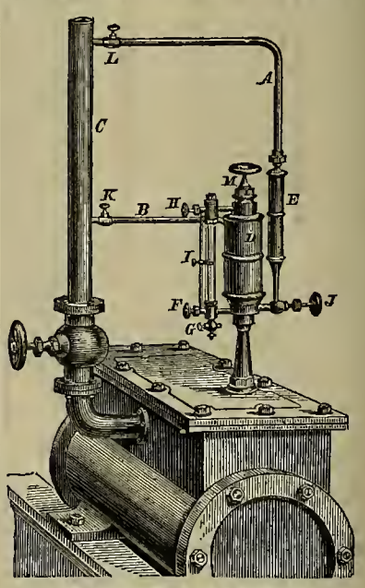
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM
Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; T, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

PURCHASERS please say advertised in Scientific Press.

CROCKER'S PATENT TRIP HAMMER QUARTZ BATTERY.

This machine, complete, weighs 1,500 lbs. Has an iron frame, five steel arms with stamps weighing 17 lbs. each, which strike 200 blows per minute, in a mortar provided with screens on both sides, and crushes FINE 600 lbs. per hour, requiring one-horse power to drive it. Has been thoroughly tested, and is guaranteed to give good satisfaction. PRICE, $400.

G. D. CROCKER,

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity puiverizing and amalgamating ores, they have no eqnal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the greet number now in operation, not one has ever reqnired repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the puip, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the puip to the center, where it is drewn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates egein draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfeces and into the quicksilver, until the ore is redneed to an impelpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others They bring the puip so constantly and perfectly in contact with quicksilver, that the particles ere rapidly and completely absorbed.

Mill-men are invited to examine these pans and settera for themselves, et the office, 229 Fremont Street, San Francisco

[MINING SUMMARY.—Continued from Page 309.]

Utah.

LITTLE COTTONWOOD DISTRICT.

THE GRIZZLY.—Salt Lake *Tribune*, Nov. 6: This mine shipped 200 tons last week and expect to make a good ehipment this week. The Grizzly ehows in all its works the largeet hody of fine ore that we have seen, and that we are eatisfied cannot he ehowu hy any other mine in our district. The first and second levels show a continuous hody of ore on each side, and over head as well. The incline ie 75 ft. down and rune from the second level in good ore, at the end of which a uew incline has been commenced, running in a southerly direction abont 30 ft. in a solid body of ore, ahout six feet wide. The ore ie easily taken ont and requiree no blasting. All the different levels and inclinee have been carefully timbered.

THE EMMA shipped 90 tone for the week, and is still washing the secoud-class dump. The new assay office has just been completed.

THE VALLEJO shipped ahout 60 tons laet week, and ie generally looking well.

THE WELLINGTON, it ie rumored, hae struck a good body of ore in their tunnel.

THE LADY ESTEN TUNNEL is making extensive preparations to work this winter. This company has worked winter and summer for the laet two yeare, but has not ae yet struck anything of importance.

THE PIONEER No. 2 ie ahont 300 ft. from the Flagetaff mine, and hae a body of fine ore in ite shaft, specimens which we have eeen showing an assay of $200 in silver. The body is ahout one foot wide.

THE DAVENPORT ehipped 480 tone during last week, and 800 tone for the month of Octoher. The mine is improving daily.

THE REED & BENSON, in Big Cottonwood, ie working in a large hody of valnable ore, and is shipping daily. The tramway is not quite covered. The mine is to be worked all winter, and will be ahle to ehip its oree without difficulty.

THE FLAGSTAFF is etill cloeed. The men are here awaiting their pay, which is expected on the 6th. The new ore house is ahont completed, and it is to he hoped that the company will soou reeume the development of thie property.

TINTIC DISTRICT.

THE WYOMING MILL.—*Tribune*, Nov. 4: Thie mill, eitnated at Homaneville, started up recently, and expecte to keep running this winter, mainly, we are informed, on ore supplied by the Sunheam mine, recently purchaeed by that company.

THE OLD SMELTER at Homansville, ie also being started up on an experimental basis, by Mr. Nesbitt, Superintendent of the Enreka Mining Company's works, who propoeee, hy meane of some peculiar invention of his own, to smelt refractory ores to advantage, which have hitherto proved non-paying.

THE MAMMOTH.—We are informed the appearance of their mines underground is that of steady improvement, on what was of iteelf originally very good, to say the least. The Copperopolis Smelting Works, we understand, answer well. The mill helonging to that company is not yet at work.

Washington Territory.

THE SWAUK RIVER GOLD MINES.—Portland (Or.) *Bulletin*, Nov. 4: Much interest has lately been awakened in this State and Washington Territory by reporte of rich discoveries of gold placers on the Swauk River. We yesterday received a call from Mr. John Shoudy, a gentleman just down from the new El Dorado, and from him we have received the following interesting information: The mines are located in Washington Territory, on the Swauk River, a branch of the Yakima, ahout 150 miles from the Dalles. The Swauk River is twenty-five miles in length, and from ite eource to its mouth rich indicatione are found at every point, as aleo on its small tributaries, and in the eurrounding hille. A mining company has just been formed, compoeed of ten members, with Thomae Goodwin as President, and active operations inangnrated — many slnices having hesn put in when our informant left.

Specimens hrought to this city by Mr. Shoudy aeceyed $14.50 to the ounce—weighing 3.85 previous to assay and 3.45 after—.742 gold. Several of the prospectors have picked up solid lumps weighing from half an ounce to one ounce. Old miners give it as their opinion that the new diggings will "pan out" remarkably well. The company just formed have already taken up eleven claime, and eager prospectors are out in every direction. Mr. Mycock, one of the diecoverers, sold ont one claim for 27 head of cattle, to provide heef for the eettlement. Living at the new diggings is almost ae cheap ae in Portland—the principal staple, flour, costing only $7 per hariel, and other neceearies of life in proportion. Mr. Shondy is very enthnsiastic with regard to the new placers, and thinks the party have certainly "etruck it rich." Should subsequent developments verify their expectations, we may look for a regular stampede in the spring toward the Swauk River from all directions. Great excitement exiete in that section of the country. Ahout 300 persone are already at the mines, in varioue localities, and hnndreds are preparing to go to the diggings. Mining laws are in force, and claims are recorded at the very low sum of $1. Three yeare ago prospectors found very favorahle indications at the head of the Yakima River, and the impression has alwaye prevailed that the region wae of an auriferoue character. The minee are easily accesihle from the Dalles —plenty of freighting facilities, at 7 cente per pound.

DEWEY & CO'S
SCIENTIFIC PRESS
Patent Agency.

SCIENTIFIC PRESS—Mining and Mechanical. PACIFIC RURAL PRESS—Agricultural.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent ousiness, and obtain Patents in *all civilized countries*. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice ns to the patentability of new inventions. ADVICE AND CIRCULARS FREE.

HALLIDIE'S
Patent Endless Wire Ropeway.
Covered by Numerous U. S. Patents.

IMPORTANT TO
Mining Companiss, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I hog to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN - My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mins in Freihurg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get ont of order—nothing to wear out. While ours requires hut about two thousand five hnndred feet of wire rope, I can see no reason why the lins could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might he donbled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to yon, nse it in any way yon think proper. Very respectfully, C. C. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO.,
Little Cottonwood, Utan,
Superintendent's Office, Sept. 28, 1872.

T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may he on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall to this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,
113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE 113 and 115 Pine St.

GIANT POWDER.

Patented May 26, 1868.

THE ONLY SAFE BLASTING POWDER IN USE.

GIANT POWDER, NO. 1,
For hard and wet Rock, Iron, Copper, etc., and Submarine Blasting.

GIANT POWDER, NO. 2,
For medium and seamy Rock, Lime, Marble, Sulphur, Coal, Pipe Clay and Gravel Bank Blasting, Wood, etc.

Its EXCLUSIVE use saves from 30 to 60 per cent. in expenses, besides doing the work in half the time required for black powder.

☞ The only Blasting Powder used in Europe and the Eastern States.

BANDMANN, NIELSEN & CO.,
20v22-3m16p General Agents, No. 210 Front Street.

SAN FRANCISCO, SATURDAY, NOVEMBER 22, 1873.

VOLUME XXVII. Number 21.

The Napa Insane Asylum.

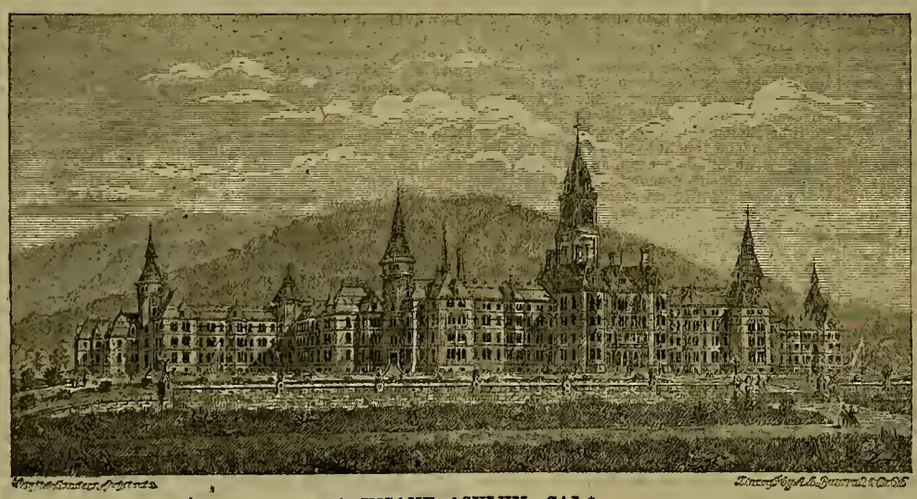
For a long time the State Insane Asylum at Stockton has been confessedly inadequate in size. When it was built, the calculated accommodation for 600 inmates was considered ample. But it was soon found that sufficient allowance had not been made. There is something in the high-pressure mode of living—some call it the result of the prevailing stock gambling, which, it is asserted, leavens our whole social and commercial being—here, which is evidently beyond the grasp of ordinary statistics. And though the State has grown rapidly, the number of her insane has increased still more.

It was to relieve the present overcrowded Stockton asylum, that the noble structure which we here illustrate, was planned. There are now 1,290 patients at the former place, or about double the number for which the building was constructed. The sooner, therefore, the new asylum is finished, the better for all. The foundations are all in, and part of the basement story. The building is to be put up in three sections, each of which, complete in itself, will be thrown open to patients, when finished. The principal material is brick, and from the plans, and what is now built, the asylum promises to be solid and substantial in all its parts, as well as imposing in appearance. The stipulated cost is $600,000

The architects, Messrs. Wright and Sanders, of this city, have paid especial attention to the sanitary requirements demanded for the purpose for which the asylum is intended. They have worked on the principles laid down for the construction of hospitals, at the convention of medical superintendents of American institutions for the insane, in 1871. All the appointments of offices, reception rooms, dormitories, baths, day rooms, library, store rooms, etc., will be complete. The wards for excited patients are to have on one side of the corridor a conservatory for flowering plants, birds, etc., and a water fountain in the center of each. Thorough ventilation will be secured by means of large galvanized iron tubes, receiving the vitiated air from the different wards and discharging it through the towers and ventilating turrets. Downward currents of fresh air are to be secured by an arrangement of pipes, terminating in the fire-boxes of the boilers. Ample provision will be made for protection against fire, by numerous hydrants throughout the building and by the partially fire-proof nature of its construction.

It is to be regretted that the new asylum was not finished long ago. Roominess is one of the first requisites in effecting cures, and when twice as many persons are crowded together as there is properly room for, as at Stockton, the effect can be imagined. It will thus be seen that complaints made against the management of the Stockton asylum are solely on this ground.

The architects are to be congratulated on the excellence of their plan. The outlines are such that they will far surpass in reality their appearance on paper.



NAPA INSANE ASYLUM, CAL.*

*This engraving, with some of the facts accompanying it, is taken from Menifee's Sketch Book of Napa, Sonoma, Lake and Mendocino counties, now published by Haas Bros., Napa City, Cal.

Coal Mining.

Coal mining by machinery is being rapidly introduced in Great Britain. Several of these machines are described in Saward's New York *Coal Trade Circular*. Most of them are worked by compressed air, a few by hand and by steam. They are on the same principle. They aim at imitating the hand pick stroke. They usually cut out an undermining 2¼ inches, tapering to 1¼ inches. The cut is about 2½ feet deep, and they usually progress about 30 yards per hour. One machine weighing 15 cwt. and costing $500, cuts 80 tons a day of ordinary coal, with two men and one boy. A new hand learns in a few days to master its working.

We ask attention to the above brief description of what is being done, to cheapen coal mining one-half and to reduce wasteage of the seam fully as much.

From all parts of California we have coal discoveries—north, south and east, so that instead of being almost destitute of mineral fuel, we are likely to find ourselves amply provided.

Our coals are inferior to those of England and of Pennsylvania; but though of comparatively light weight and copious ash, our coals are generally free from sulphur and equal to average wood as fuel. In size, too, the seams exceed the average elsewhere, which adapts them particularly to machine mining.

For all purposes which Diablo coal answers, almost all our newly discovered coals can be profitably used; and generally they have much less sulphur.

Perhaps we may find new ways to burn these lignite coals, so as to smelt iron. We find iron ore almost every where, not far off, and this is usually accepted as Nature's hint that the two will work together. Enterprise may venture to make experiments and expend capital in finding ways to smelt iron ore with our lightest lignites under such circumstances of juxtaposition.

The mines in Storey county, Nevada, turned out 121,200 tons of ore during the past quarter, valued at $4,616,650. Of this amount the Belcher turned out 35,060 tons, valued at $2,252,550 and Crown Point, 30,100 tons, valued at $1,752,700.

The North Star Mining Company's ten-stamp mill in Star District, Utah, has been running since the 27th ult. successfully.

Oleomargarine.

The California Oleomargarine Manufacturing Company, West Evans, President, Henry Phillips, General Manager, and John G. Baker, Secretary, commenced operations during the past week at No. 405 Sansome St., in this city.

They announce that they are prepared to supply the market with the best quality of *fresh butter*, at greatly reduced prices. That this new style of butter, manufactured from suet of fresh beef, is endorsed by some of the ablest chemists of this country, including Professors Silliman, Hossford, Chandler and Doremus. The latter, who holds the position as Prof. of Chemistry at Bellevue Hospital, Medical College, and also at the College of the City of New York, speaks very favorably of it, as will be seen from some extracts we give from a recent letter published in full in the *Alta* of Nov. 4th.

Bellevue Hospital Medical College,
New York, August 18th, 1873.

Vernon Seaman, Esq.—Dear Sir: The butter fabricated from the fresh fat of beeves by the process of Mr. Alfred Paraf, contains, according to analysis made in my Chemical Laboratory, the constituents of the best butter from cow's milk, with no greater variations in the proportions of said ingredients than are found in samples from different dairies, with the omission of some abnormal substances which excite and facilitate the well known changes in ordinary butter.

It is a pure, sweet and palatable butter.

I have samples of the butter prepared after this novel and rapid process, which I have kept for five months, and they are well preserved, whilst butter, supplied by one of our first-class grocers and similarly exposed, has become disgusting to the sense of smell and utterly unpalatable. Experiment, therefore, verifies theory.

In my opinion, butter made according to Mr. Paraf's method, is better adapted for transportation and preservation than any butter produced from milk alone.

As a chemist, I deem this discovery as one of the most remarkable of the age, and give it my unqualified recommendation.

I have the honor to remain, your ob't s'vt.
(Signed,) R. Ogden Doremus.
Prof. of Chemistry and Toxicology, Bellevue Hospital, Medical College, and Professor of Chemistry and Physics, College of the City of New York.

As we were invited to take a look through the establishment, we give a brief description of the mechanical process through which the suet passes, until it emerges from the churn as a new article of commerce. The suet, fresh from the slaughter house, is thrown into a vat of cold water and thoroughly washed. It is now ground in a machine similar to a sausage cutter and then 700 or 800 pounds of the hash are put into a large tub with about an equal weight of water. The steam is immediately turned on and the contents of the vessel brought to a heat of low temperature. After standing from one to two hours, the oil and stearine arise to the top, the scraps sink to the bottom, the water occupying the intermediate space.

The oil and stearine are now readily drawn off, placed in sacks and put in large quantity under a powerful press. By this process the oil is thoroughly separated from the stearine; the latter being left in the cloths or sacks, while the former is pressed out and discharged into suitable receivers. About one-fourth part of milk is now added to the oil, when it is churned, worked and prepared for the market.

We have no further personal knowledge of the merits of this new "home product," and advise our readers to try it for themselves.

Nickeliferous Sand from Frazer River.

The sand obtained from the gold washings of Frazer river has very much the appearance of small particles of iron pyrites, being of a decidedly yellow color. Dr. Blake, noticing some of its peculiarities, has made an analysis of the sand the results of which he communicated to the California Academy of Sciences at its last meeting. Under the microscope it is found to consist of two distinct substances, one of which is evidently magnetic oxide of iron or the common black sand of our gold deposits; the other is of a yellow color in the form of small scales, without any well marked crystalline structure, and the edges of which have been rounded by abrasion. The whole of the sand is strongly magnetic, so that with the exception of a few scales of gold, it contains nothing that is not taken up by the magnet. An analysis of the sand shows that it contains nothing but the oxides of nickel and iron: 0.9153 grm. of the sand yielded 0.330 sesquioxide of iron and 0.6035 oxide of nickel, which would give, supposing the iron to be in the state of magnetic oxide, 0.275 of oxide of iron, and if we suppose an analogous oxide of nickel to exist we should have 0.647 of the magnetic oxide of nickel: thus making 0.9220 instead of 0.9153, the excess of 0.007 being undoubtedly due to the nickel from the difficulty of freeing it completely from the potash with which it is precipitated.

Although Dr. Blake can find no mention of such a compound of nickel either in Watson's Dictionary of Chemistry or in Dana's Mineralogy, yet he has no doubt that the form in which the nickel exists in this sand is as an oxide, with the composition $Ni^3 O^4$, analogous to the magnetic oxide of iron $Fe^3 O^4$, thus establishing another relation between the compounds of nickel and iron. From the very large proportion of it in the sand, fully 75 per cent., it is strange that its presence has not been before noticed.

The Japa placer mines in Lower California are still attracting considerable attention in the "lower country." Many people have left Julian City and San Diego for the new mines. Reports from there show that the mines are rich, but the usual drawback in that part of the country—want of water—will retard progress. A correspondent of the San Diego *Union* who has lately returned from the diggings says the men there make from $1 to $4 per day with pans and $5 to $7 with rockers. The dust in this case must be pretty rich taking into consideration the fact that it is carried three miles to water. Perhaps with proper dams and sluices to utilize the rains, the diggings might prove lucrative.

Weekly Variations in Stocks.

Our Weekly Stock Review.

THURSDAY EVE. Nov. 20, 1873.

The stock market has not been particularly active this week, though news from the mines continues good. Aeeessmente are quite plentiful however, just now, as money is wanted for supplies, prospecting, etc., during the winter months. The dividends for the month do not foot np over $750,000 from companies listed on the boarde. The assessments delinquent this month are as follows:

Name.	Per Share.	Amount.
American Flag	$1 00	$40,000
Belmont	1 50	45,000
Daney	50	12,000
El Dorado South	1 50	60,000
Empire	1 00	25,000
Globe	50	10,000
Hale & Norcross	5 00	80,000
Ida Elmore	3 00	30,000
Independent	50	12,500
Julia	1 00	30,000
N. Y. Consolidated	25	9,000
Ophir	5 00	84,000
Phoenix	50	25,000
Red Jacket	1 00	20,000
Union Consolidated	50	10,000
Virtue	75	15,000
Washington & Creole	1 00	30,000
Wellington	25	12,000

Dividends for the year as compared with assessments have been as follows:

	Assessments. No.	Assessments. Amount.	Dividends. No.	Dividends. Amount.
January	24	$550,060	7	$573,181
February	30	586,000	7	849,000
March	36	581,950	5	811,000
April	18	388,860	4	1,090,000
May	20	615,900	3	1,872,000
June	22	430,500	8	2,232,000
July	35	742,700	7	1,389,500
August	21	580,850	7	1,270,500
September	24	323,033	8	1,052,500
October	24	678,500	5	698,500
November	18	550,000	4	751,000
Totals	274	$5,029,443	66	$12,589,181

The comparison shows a gain of $6,560,000 in favor of the stockholders.

Tho Consolidated Virginia shipped on the 18th, $67,936. Daily yield 140 tons of ore.

The Eureka mine, Graee Valley, turned out 1,150 ounces of gold amalgam last week.

The ehipments from the Raymond & Ely aggregate $67,800 thus far in November.

A QUICKSILVEB mine wae discovered a few daye eince, about six milee north of Windsor, upon the ranch of W. J. McClindon.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

I. X. L.—Alpine *Miner*, Nov. 15: Thie mine ie again yielding ore for the mill. We are not so well aseured of its qnality ae of that from the Fremont, but from paet yields do not douht it is of good qualiiy.

SILVER GLANCE.—Work in the Silver Glance shaft progreesee slowly. The hoisting works are in operation.

THE M. & N. W. Co.—The M. & N. W. Co.'e dam, near their mill on the Oarson river, hae heen undergoing thorough repairs, and may now be considered complete, as all thnt remains to do is to fill in below the apron with rocke, and to do some work on the east pier. Experte pronounce the structnre safe, and mnch improved in every way.

RICH ORE.—A sight of the ore being taken from the Fremont mine in Silver Monntain is good for sore eyes. Car samples will run high into the hnndreds, if they do not reach a thousand dollars per ton. It ie helieved by old reeidente of the oounty that the lode upon which are located the Bnckeye No. 2—*i. e.* Exchequer Co.'s mine—the Fremont, Saugatuck and Lady Franklin Companies will, when once fully developed, prove a second Comstock.

AMADOR COUNTY.

AMADOR CANAL.—Amador *Ledger*, Nov. 15: Work on the canal ie progreeing rapidly, a large force af men heing engoged npon it. The energetic manner with which the work is puehed ahead upon the canal will eecure the completion of this great enterpriee at an early day. Farmere, gardeners and frnit growers, can safely calculate on an abundant eupply of watsr from the canal for irrigation during the coming snmmer, and for mining and mechanical purposes, there will be a never ending supply from the eame source

OUR MINEE.—Work on the Valpsraieo mine at Fiddletown, is progressing rapidly, the main shaft being down over 100 feet. At the present depth the walls are well defined, with a fair ledge to work upon, and the moet encouraging prospect that the mine will eoon be developed into a permanent paying one.

THE PHILLIPS.—A continuation of the Vslpsraiso on the north, at the depth of 100 feet, the workmen have reached a well defined ledge of excellent rock, which increases in width as work progressee. The vein on which the Valparaieo and Philipe, are located, has born gold from the eurface, and when a proper depth is reached both minee will prove to be valuable.

THE VOLCANO TUNNEL.—Work ie being rapidly prosecnted, on the tnnnel, and every thing seems favorable to a successful iseue. The rock through which the tunnel ie being driven, is not hard, and as long ae ite present character continnes, progress toward the interior haein will be rapid.

ALPINE.—Very favorable reports reach us from the Alpine. The ledge has increseed to 11 ft. in thickness and of an excellent quality. All the indications in and abont the mine, as the work progresses, give assurance that the Alpine when fully developed, will rank ae a firet claee mine of the county.

THE BUNKEE HILL.—Near Amador city, holds its own and more in favorahle indications. Indeed thie mine from its situation in the grest quartz helt of the conuty, and developments already made, may he set down ae one of the permanent leads of the conuty, and about which there need he no failure.

THE PHOENIX MINE AT PLYMOUTH.—We are informed, looke remarkably well, with an immense amount of pay rock developed. In the 700-ft level the ledge hae reached 40 ft. in width and the entire maee looking very fine, and in the 600-ft. level, the rock exhibite free gold throughout. This mine is not only a very valuable one hnt has pay rock developed sufficient to keep the extensive mille connected with the mine, constantly employed for years.

FROM THE STATE OF MAINE.—Encouraging accounts come to ns. The pay rock is on the increaee, and indications very favorable. Work in developing the mine ie being vigorously prosecuted, and within a reasonable time, we shall hear a good report from the old Granite State.

KENNEDY.—Thie mine continues to yield rich rock, with a large amount of very valuable ore developed, rendering the Kennedy one of the really valuable mines of the conuty.

CALAVERAS COUNTY.

GARLAND'E NEW MILL.—Is just completed. t is without exception the most substantial and best constrncted mill in the county, reflecting credit upon Mr. Breeze who hss superintended its eretion. The hatteriee contain 18 stsmpe, and the mortar blocks that receive them rest upon a eolid foundation. Everything about the mill—machinery and all—is entirely new. The motive power is to he furnished by a 35-horse powor engine, and in fact all the machinery and appliances are of the most approved constrnotion. It is expected that the hsttery will be pnt in motion the first of next week, and if it worke as well ae it looks, it will be a model mill in every respect.

GOOD HOPE MINE.—The property of M. C Garland, proprietor of the mill. Work ie being pressed forward with favorable reeults The ehaft is sunk 266 ft. and levele are being run, hoth eaet and west, from which a fai quality of ore ie ohtained. There are abon

70 tons of rock now in the dump, which will he hauled and crushed as soon as the mill is in readiness. The ledge averages about 3 ft. in thickness. The mine is supplied with first class hnisting works, the engine being of 35-horse power.

San Bruno.—The tunnel rnn to open the mine below the old works is just breaking through into the ledge. The tnnnel is something over 400 ft. in length, through hard bedrock, and will strike the vein 130 ft. below whers the ledge has been worked. Should the ore prove as rich in the lower as it did in the upper tnnnel—and there is every indication that it will—the mine will be one of the most extensivo and valnable in the district. A large quantity of fair grade ore remains in the nppor tunnel, and a contract for taking the rock out and milling it has heen let. The San Bruno is not to exceed half a mile from Garland's mill to which the qnartz ie to he hauled.

The work of ruuning a tunnel to tap the ledge of the Dolly Varden mine is nearly completed, only about 50 ft. remaining to be run. The tunnel will ont the vein at the depth of 150 ft., placing the mine in a condition to he worked advantageously. Splendid rock was taken from the shafts sunk on the ledge, the quartz paying handsomely for working from the surface down. The Dolly Varden mine is owned by Mr. Garland.

Monte Cristo.—A shaft 125 ft. deep is sunk on the mine from which first-rate rock is being taken. The ledge makes as good a showing as any in the district, and now that milling facilities are availahle will give a good account of itself.

Wolvorine mine is located on Wet Gulch, one of the widest cañons imaginable. It is at least 2,000 ft. from the mill to the bottom of the gulch, the descent heing at an angle of about 45° At the time we visited the mine no wnrk was being performed ou acconnt of the accident to the machinery which we detailed last week. It was expected, however, that damages wonld be repaired and the pumps set at work taking out the water that has accumulated since the accident, last (Friday) night. The Wolverine is supplied with a ten-stamp battery, hoisting works and Cornish-pump, all run hy a 35-horse power engine. The shaft is snnk to the depth of 345 ft., aud the work of sinking 200 ft. deeper is now in progress. Levels have been run, north and sonth, at the depths of 200 and 300 ft., respectively, and a considerable qnantity of good ore taken ont and milled. Pay chimneys have been found hoth sides of the shaft, and the latter is going down through first-class ore. When the depth of 500 feet is reached and the stopes opened out, we have the fullest confidence that the Wolverine will never cease paying dividends. The ledge is a wide one, averaging nearly or quite fonr ft.

Sanderson Mine.—At present the Sanderson is making a better showing and attracting more attention than any other miue in the county. Rock of the most unprecedented richness is being obtained from the north level at a depth of 200 ft. Free gold is diffused all through the ore, good judges estimating that it will mill $400 per ton. The level has heen run 42 ft. in this character of rock, and still the chimney is not ent through. There is money enough in sight to pay three dollars for overy one the mine has cost, and yet prospecting the ledge has scarcely commenced. The vein averages about two ft. and a half in width, the quartz being of a dark hlne color, carrying iron and galena snlphnrets in addition to the free gold. The shaft is to he snnk 300 feet deeper as soon as practica'ole, it heing the intention of the Snperintendent, Mr. F. Homer, to make use of compressed air in sinkiug. The Sanderson is furnished with steam hoisting works and a Cornish pump, hut has no mill. It is the intentiou to pnt up a hattery when the contemplated sinking is completed.

EL DORADO COUNTY.

Mining Enterprise. — *Mountain Democrat*, Nov. 15: Messrs. Maffey & Murray have erected a fine five-stamp mill on their claim—formerly known ae the Buckner claim—ahont 1½ miles sontheast fram Nashville, in this county. They have twelve hundred feet of veiu matter, which averages about twenty feet in width, composed of decomposed porphyry and quartz seams, which yields in many placee as high as $3 to the pan from the pulverized matter along the seams, while unselected and unassorted samples of the average vein matter have uniformly assayed $140 and npward per tou. Mr. Murray was in this city last Thursday, for the purpose of procuring die castings at Morcy's Foundry, which will complete the equipment of the mill, and they expect to start up to test the machinery next Monday, and to commence crushing shortly thereafter. Quite a nnmher of other companies are preparing to commence operations in the same vicinity, of which we are promised further advices soon.

INYO COUNTY.

Rebuilt.—Inyo *Independent*, Nov. 8: Mr. Beaudry has been engaged for some time past in tearing out the old works of his furnace, deepening the foundation some four ft. and replacing the works anew. The new furnace is considerahly larger than the old one, but we cannot say how much its capacity is enpposed to he iucreased thereby. The change hae involved a large amount of labor and expense.

Bullion.—From A. K. Briggs, late from Olauche, we learn that on an average about six large teams load daily at Cartago with hullion, but with the constant accesions from the furnaces the piles are not sensibly dimiuished. Some 3,000 bars are stacked up there ahead of the teams, besides still greater amounts remaining at the furnaces.

KERN COUNTY.

Good Rock.—Havilah *Miner*, Nov. 8: Mr. Yoknm of Long Tom is now working npon some excellent rock.

The Bacohus Mill made a clean np Wednesday.

H. Meyers and his partners have got dnwn forty ft. on the Prospector lead, on the Grizzly mountain. They say the lead is spreading as they progress, and that it continues to prosper well.

NAPA COUNTY.

Yellow Jacket.—Calistoga *Tribune*, "Mr. William A. Stuart, proprietor of the Yellow Jacket mine, a day or two ago showed us some wonderfully rich specimens of ore from that mine—rich in native qnicksilver—some of them containing globnles of native metal as large as buckshot, and not inferior to anything yet found at the Rattlesnake, or any nther mine." The Yellow Jacket is little developed as yet, but the indicatioos are that it will turn out one of the richest mines in California, or in the world.

NEVADA COUNTY.

Magenta.—Grass Valley *Union*, Nov. 13: This mine shows a new capability in sending out gold. Yesterday the ledge was broken in the stopes at a point 75 ft. distant from where good specimen rock has been taken for the last two weeks, and the ledge broken is very rich in free gold. It has also heavy and rich snlphnrets and a lively appearance of the qnartz. The chances are that the Magenta is on the point of showing a most wonderful richness. There is gold in all the rock so far taken out of the mine.

The Bradley mine, leased and worked by McFate & Co., threw out a chunk of rock worth $600, the other day. The mine is located at Willow Valley, above Nevada City.

SIERRA COUNTY.

New Claim.—Mountain *Messenger*, Nov. 8: Work will soon be commenced on a gravel claim about four miles below Eureka the cañon ck. side of the ridge. It is thonght that there is a large deposit of gravel under the ridge.

Prospecting.—Work on the prospect tunnel going in east of Eureka, near Meredith's old sawmill, is being pushed forward rapidly. Arrangements aro heing made to continue work dnring the winter.

Oak Ranch.—The prospecting tunnel under Oak Ranch on which work was commenced ahout ten weeks ago, is now in two hundred and eighty ft. going forward as fast as two shafts can push it. The owners are sanguine of finding diggings.

SAN BERNARDINO COUNTY.

Palm.—The San Bernardino *Guardian* states the following regarding the mines in Palm District: Work in the miues of Messrs. Frank & Co., situated in the palm district, is heing vigorously pushed shead, and, we are informed, with great success. The company is now at work on tho "Blue Jay" mine, having snnk three shafts on it in three diffcrent places, the ore showiug exceedingly well, and we are positively assured that it really exceeds their most sanguine expectations. They are now running two arastras and are taking ont ahont $40 per day. We are told they have in sight sufficient ore for a forty-stamp mill. Parties from there represeut to us the "Blue Jay" as the finest ledge yet discovered in San Bernardino county. They say it is as fine a sight as they ever witnessed to go to the dump and see the gold in every piece of ore picked up The other ledges owned by the company in Palm District are all turning out well,

SISKIYOU COUNTY.

Items.—Yreka *Union*, Nov. 15: The Dutch Boye down below "Andy's" are fitting up their diggings for winter. W. R. Boyd, having eome time ago disposed of his interest in the firm of Benl.ett & Co. to his partners, is husy fitting up Fort Bar to he ready for extensive operations when the water comes. J. E. Horn has pnrchased the Stony Bar claim, and is busy "fixing up" for winter. George McNeal also is making preparations to "draw on the bank," as soon as there is sufficient water. The Shumway Brothers up the North Fork have just put up a derrick and repaired their flumes and ditch, and made all the necessary preparations to make things livcly in that direction next winter. On the South Fork, Bennett & Miller have their dam finished in a substantial manner, and the water from it running down as far as the lower end of Butcher Flat, and expect to soon have it as far as the "Forks." R. Glasgow, a veteran prospector, with a large stock of hope and an ample supply of perseverance, hae located on Stone's Bar, and commenced to build himeelf a "local habitation." We have of late had a small local excitement here, caused hy the discovery of coarse gold in a small tributary of the South Fork, ahont five miles above here, generally known as "Niggerville Creek." The discoverers—T. Adams and a Frenchman known ae Chicken—gave it the dignified cognomen of the "Chicken Roost."

TRINITY COUNTY.

Pile Driver.—Trinity *Journal*, Nov. 15: The Weaver Creek Milling, Mining and Fluming Company are now at work driving piles with a pile driver, helow their flume. It is the intention of the company to drive piles for a distance of twelve hundred feet, and then hoard them up, in order to corral the water and keep it from spreading. Being thus kept together it ie expected the water will carry the tailiuge a much greater distance and thereby obviate the necessity of adding so many hoxes at the lower end of the flume.

Canon City.—Max Lang informs us that during the late visit to the above place he fonnd things lively. Also that J. Depinett & Co. have found excellent prospects and intend fitting their claim np in good shape. They have ordered 1,000 feet of iron pipe.

Indian Creek.—A. T. Corbns tells us that miners in that section are ready for winter and now wait for winter with which to commence active operations.

TUOLUMNE COUNTY.

The old Buchanan Mine.—*Union Democrat*, Nov. 15: What we learn from this mine is highly enconraging. A gentleman who was through it this week, informs ns the vein is 8 or 9 feet wide, and while he was there some 10 or 15 tons were broken down at one hlast and pieces broken off from every part of it showed free gold. Tullock since he commenced work has said it was the best vein in the county, tho way he is progressing will soon prove that he was right all the time. Our informant expresses the belief that it is one of the richest and most valnable mines in the county. The mill will soon be in order for crushing, new hatteries have been put in and overy preparation made for working to its full capacity.

Table Mountain Blue Gravel Mine.—Tuolnmne *Independent*, Nov. 15: Richer gravel has been found in the south end of this mine than was at first snpposed. Things look flattering in the extreme. In less than 60 days there will he employed on the Tahlo Mountain Blue Gravel and the Alpha, at least 100 men.

Nevada.

ELY DISTRICT.

The Washington and Creole. — Pioche *Record*, Nov. 16: Since onr last report, what we consider very important developments have heen made in this mine. Three winzes have heeu sunk on the ledge, 200 ft. apart, to a depth of 100 ft., in each of which is found ore assaying, as per certificates of 15 assays which we have inspected, $435 per ton in gold and silver, the percentage in gold being unusnally high, and one certificate showing $1,054.03 in gold per ton. An additional force of 100 men has heen recently engaged, and as soon as room can he made, stoping and drifting from the hottom of the winzes will he commenced to further the value of this deposit. The milling of this ore will he commenced on or about the 23d of this month. They are hoisting now from 15 to 20 tons of ore per day.

Raymond ann Ely.—At present are working 75 men on a shift; having heen obliged to discharge a number of men on acconnt of a break in the machinery, which will be repaired hy to-morrow (Monday), and the usual force of men will be put to work. This company is extracting 60 to 75 tons of ore per day, and still sinkiug for the 1,000-ft. level, and are within 15 ft. of it.

Chief of the Hill.—A progress of 14 ft. has heen made in a drift from the 210-ft. level; also in a drift ou the 360-ft. level a progress of 8 ft. has been made in the drift from the Burke Tnnnel level. Working 20 men. All prospecting.

Pioche.—Mr. Nelson iuforms us that work on the new huilding is being pushed forward rapidly. They are still working in the old shaft, and are taking out some ore. They sre erecting a whim over the old shaft.

Mazeppa.—The Washington and Creole company, having purchased this mine, we are informed hy the Superintendeut that work will be commenced on it on or hefore tho first of next month.

Peavine.—Drifting is going on in this mine; a good ledge, 1 ft. in width, is in sight.

Bowery.—Sinking is going on as usual; have cut through a seam, and everything looks very eucouraging.

Portland.—This company has commenced sinking for the 400-ft. level, and is running a drift from the 300-ft. level.

Amador.—Still sinking the shaft. Its present depth is 412 ft. Working full force of men.

Huhn and Hunt.—Drifting and sinking is still going on.

Alps.—The drift runs south at the 300-ft. level, and is progressing favorahly.

WASHOE DISTRICT.

Sierra Nevada.—Gold Hill *News*, Nov. 15: After years of snrface working and prospecting the company have resolved to place this mine in point of works, machinery and mining operations, with the first-class mines of the Comstock; and in doing eo there will be scarcely a doubt that when deeper levels are opened it will assume a position second to none on the ledge in the production of ore and hullion. The company own 3600 feet on the Comstock ledge, besides several minor locations on Cedar Hill hack of the main ledge. A site has been selected 1000 feet north and 1100 feet east of the old works, near the center of the claim, for the erection of new hoisting works and sinking a new shaft. It ie the intention to immediately commence sinking the shaft. Temporary hoisting works with a donkey engine to do the hoisting will he erected for the winter. With these it ie expected that the shaft can be snnk to the depth of 500 or 600 feet. As soon as spring opens, permanent works, with the heaviest and hest improved machinery it is possible to get, will be erected. It is the intention to sink the shaft 1,000 feet before commencing to drift. Taking the present inclination of the ledge as a guide, the new shaft will pass through the ledge and strike the west wall at a depth of 2200 feet. The prospecting drifts in the old Sacramento ground are showing much hetter, and it is expected that enough ore will soon be developed to again start the old Sacramento mill. Daily yield 60 tons, from the old upper levels.

Consolidated Virginia.—Daily yield 140 tons of ore. The decrease in the amount of ore extracted is not caused hy any change in the ore producing sections, hut by inability to get the ore milled as fast as extracted, the dumps all being full. The railroad company are erecting the trestle work and pushing the building of the branch road for taking away the ore direct from the dump as fast as possihle. Sinking the shaft is making exeellent progress. Air compressors for running small hoisting engines have heen sent east for and will arrive in a very short time. As soon as they can be erected, small hoisting engines will he placed at the mouth of both the north and south winzes on the 1200-foot level, and these winzes pushed ahead to the 1500-foot level to conuect with another drift which has just been started on that level from the Gonld & Curry, thus prospecting and ventilating the lower levels of the mine hy the time the main shaft has reached that depth, which will probahly take three or four months to do.

Woonville.—The new shaft is down 80 feet, at which depth the flow of water became so bothersome that work has been snspended until the erection of the building and hoisting machinery can he completed. Sinking the incline in the old works is making good progress, following the line of the ledge and still in good ore. The ore stopes in the north drift on the 300-ft. level are yielding the usual amount of milling ore.

Hale & Norcross.—The main incline is down 188 feet below the 1,700-ft. level. The sinking is making good progress. The heat on the 1,700-ft. level is intense, notwithstanding which the work ie pushed steadily ahead. The usual amount of ore is being extracted from the old upper levels.

Silver Hill.—A heavy flow of water stopped all work in the shaft for the first three days of the week, hut was soon exhausted hy the pnmp; and sinking is again heing vigorously prosecuted.

Nevada.—The extraction of oro from the large hody exteudiug from the south drift toward the snrface has been commenced. Sufficient milling tests have heen made to give the assurance that the company has aluost an incalculable amount of ore near the surface easily mined and can be takon out through the tnnnel, and which will pay a good fair profit for working.

Baltimore Consolidated.—The shaft is now down 50 ft. below the third station, the gronnd working fiuely and the sinking making rapid progress. The ore hody at the first station has shown considerable improvement during the past week.

Chollar-Potosi.—Daily yield 140 tons of ore, assaying $40 per tou. The ore breasts and stopes are all yielding finely. The prospecting drift at the third station showe a decided improvement, and promises a fine development of ore.

Calenonia.—All work in the shaft is snspended for the present for the purpose of pntting in new and improved hoisting reels. The company have sufficient ore extracted to keep the Sapphire mill running until extracting ore can be again resumed.

Sutro.—Drift in 75 ft. Superintendent Sheridan has increased his working force, so as to he ahle to run night and day. The work of drifting is being pushed forward at the rate of 5 ft. every 24 hours. Ledge matter enconntered all along. Cross-cutting will he commenced in few days.

Mint.—Sinking the shaft is making rapid progress, the rock in the bottom working finely. The machinery is all in fine working condition, and there seems no good reason why some good ore developments should not be made when a sufficient depth is attained.

Occidental.—Operations in this mine are exclusively directed toward the exploration of the ore vein in the portion already drained of water. The main adit is now repaired and in excellent condition through its entire length.

New York Consolidated.—The shaft is down 400 ft., the rock in the hottom heing quite soft, with a mixture of clay and qnartz. The sinking is making excellent progress.

Imperial.—Prospecting the lower levels continnes. Sinking the main incline is making the usual good progress.

Julia.—The water in the shaft has been drained to within 25 ft. of the 1,000-ft. level, and is steadily decreasing. The main southwest drift is being rapidly pushed ahead, the entire face of the drift in solid clay, which is supposed to he the east wall of the ledge.

Arizona, Utah ann Globe.—The face of the main west drift at the 400-ft. level is, one-half of it, in fine looking quartz, with spots of ore of a very promising character. The south drift at the hottom of the incline is looking much more promising, and the development of a body of pay ore seems much more favorable.

Alpha.—A drift north has been started from the 1,700-ft. level of the Imperial, which will prospect the mine several hnndred feet deeper than it has ever been worked heretofore.

Ophir.—Prospecting the lower level continues, with much more favorable indications of paying ore on the 1,700-ft. level.

Succor.—Sinking the new shaft east of the hill is making excellent progress. The ledge in the east drift, from the small shaft in the cañon, is widening out, and steadily improving in quality.

Daney.—The shaft is down 240 ft., the rock

[Continued on Page 336.]

The Panamint Mines.

A correspondent of the Inyo *Independent*, who has just returned from Panamint says:

Leaving Little Lake we struck off dne east, passing over sand and lava most of the way. About 20 miles from Little Lake yon strike the first water; twelve miles farther you come to another spring—excellent water—in a cañon; passing down this cañou you come to Panamint Valley; crossing the valley you come to what is known as "Postoffice Spring," at the base of Panamint mountain. Leaving the camping place you bear a little north of east; 3½ miles brings you to the mouth of Surprise Cañon. Upon entering this cañon you are struck with the rough, unfinished work of a volcano of the unknown ages; passing up the cañon you arrive at the newly laid out city known and recorded as Pantamint City. The cañon is not over three hundred yards wide where the town site is laid out, bnt is about two miles in length.

But little work has been done on any of the mines or lodes, bnt what have been worked show a large body of good ore.

The Little Chief

Has some work done on it, and shows a body of ore some four feet in width. The assays made go from $196 to $806. This mine is honded for $10,000; is owned at present by Tipton & Co. The next ledge we come to is the

North Chief;

No work done of any account, but it shows a good body of mineral. This ledge is owned by your humble eervant, which accounts for no work being done. In crossing over the hill we passed over quite a number of small ledges; nearly all show good indications. The next ledge we come to is the

Marble Lode,

And it has a huge ledge. It will average twelve feet in width, and can be traced, I think, three miles. The northern portion shows the greatest amonnt of mineral. Among the locators are Bob Stewart and Kennedy. The former bonded his interest in this ledge and the "Wonder" lode for $35,000. The north end of this ledge is owned by Kennedy & Co., and is knowon as the "Wyoming." The next lode of note we visited was the

Wonder of the World,

A big name, but it deserves it. It rnns nearly parallel with the famous Marble Lode, at a distance, I shonld judge, on a bee line, of about two miles. This ledge shows more mineral than any in the camp or distriot. I believe I can safely say, withont stretching my conscience a great deal, that there is enongh ore in sight to keep ten forty-stamp mills running two years.

The smallest lode I visited showed mineral.

There are some locations made some six or eight miles north, which show good ore, and the owners say they can make a stake if they can keep on the top of the "bed rock" until they develop their mines sufficiently to bring them into note. There are quite a number of

Lead Lodes,

Sufficient for smelting, should their ores be snoh that cannot be redneed by mill process. The district has abundance of wood for fuel and sufficient water for all purposes.

The altitnde of the town site I believe Mr. Kraus, the surveyor, said was about 7,000 feet; geographical location: Township 23 S, Range 44 East.

A wagon road can be made from Desert Springs to the month of the cañon for about $1,000, and up the cañon to the town for some $12,000.

I think in a year or two Panamint will be all tbe talk on Montgomery street, among the stook brokers of San Francisco.

Interruption of River Mining.—During the month of Jnly last, the Stanislaus River Mining Company, of which Thomas Derby is President, reinaugurated mining operations in the bed of the river named, which has not been worked at any place for many years past. The point selected for operations was at Central Ferry, seven miles from Jamestown, in Tnolnmne county, where the company believed the bed had never been prospected. They here constructed a dam 109 feet in length, and a flume, through which the stream was turned, 1,050 feet in length. Pnmps were then erected, worked by water-wheels placed in the flume, and the preparations were completed, so that the company commenced working the river bed below the dam dnring October. The upper gravel proved nnexpectedly rich in the anriferous, and the wealth of the diggings improved wonderfnlly below the surface. After about two weeks' operations, however, an nnfortunate accident snddenly put a damper on the glowing prospects of the company for the time, and delayed their expected acquisition of rich deposits snpposed to exist at the bed rock. On the night of Thursday last, one of the water-wheels attached to the pumps gave way, driving the water back in the flume and flooding the diggings. On inspecting the extent of the break, it was deemed injndicious to attempt a resumption of work again this year, and it was decided to snspend operations until the return of low water season next year. The company expended about $12,000 in their preparations, and had already secured some retnrn when their enterprise was enterrupted in the manner described, with every promise of eoon realizing very largely on their investment.—*Bulletin.*

The Swauk River Mines.

In addition to what we published last week on the Swank River Mines, we obtain the following information from the Walla Walla *Statesman:* For many years it has been known that gold in large quantities existed in what is known as the Yakima country, but just precisely where none were able to ascertain. The belief was strengthened by the fact that on several occasions Indians belonging to the Yakima Reservation had sold to the traders at the Dallee considerable quantities of coarse gold. On being questioned, the Indians invariably refused to disclose where they had obtained the precious metal. Confident that gold was to be fonnd in paying quantities, several prospecting parties were organized. They all found the color, but none were successful in finding sufficient to warrant them in remaining. These reports reaching the ears of several men residing near Yakima City, and confident of the existence of gold in that locality, organized themselves into a prospecting party, and about the first of August last started out, fully prepared to thoroughly explore a large extent of country. After an examination they concluded to commence operations on a small creek which empties into the Weenatchie. At the expiration of teu days a "clean up" was made, disclosing that they had only realized about seventy-five cents a day to a man. Tbis meager showing discouraged the party, and they at once determined to return home. On the 20th of September, after traveling several days they camped on the bank of the Swauk, a stream about the size of Mill Creek. While some were preparing the evening meal others were examining the stream, with the vague hope that possibly they might be fortunate enough to "strike it." Raking aronnd among the loose dirt near the water's edge one of the men discovered a piece of gold worth sbout six bits.

Encouraged by this favorable indication, the men commenced crevicing the bed rock which in places was exposed. Their exertious were soon rewarded by the sight of a $12 nugget. During the afternoon, and before supper, the party had secured in the ueighborhood of $40. The journey homeward was now indefinitely postponed. The next day they prospected up the creek for a distanco of a quarter of a mile. The result of the day's work was $164, nearly $25 to the man, there beiug seven in the party. The stream was then explored for a distance of six miles, and the farther up they went the richer the prospects. The drift from the hills on eitber side of the creek averages seveuty-five cents to the pan. Wherever the bed of the creek is exposed, gold in large qnantities is to he found. In some places the water is quite deep, and to remedy this the conrse of the creek will bave to be turned, which can be accomplished withont difficulty. The gold is coarse, the largest piece found so far weighing $18, and very much resembles the Kootenai dust. Three hundred and fifty claims have been taken up and recorded. The diggings sre two hundred miles from Walla Walla, and sixty five from Yakima City. Along the creek there is a heavy growth of timber, and, therefore, tbere will be no lack of lnmber for miniug purposes. It is thought the miuers will be able to work through the winter, as the weather in that locality is mild. For the main facts we are indebted to Mr. Goodwin, who reached here on Monday, direct from the diggings.

Steam on the Canals.

A trial of competing aspirants for the $100,000 reward offered by the State for a satisfactory solntion of the problem of canal navigation, came off last week between Syracuse and Utica on the Erie Canal. Five boats contested, viz., the Baxter, Port Byron, Central City, C. C. Pope, and the William Newman. The Baxter got the start of the other boats by 5½ hours. It is a flat-bottomed boat that with 200 tons cargo draws 5 feet 8¼ inches and is propelled by means of a pair of Baxter engines of 25 horse-power, weighing five tons, which drive two three-bladed screws in the stern, 4¼ feet diameter and 4 feet pitch, revolving with nniform movements toward each other. The Pope is propelled by a three-foot screw set in sliding gearing, and has in addition a steam windlass operated by a donkey engine, which much facilitates psssing through locks. The Newman draws six feet with 214 tons, and has a four-blsded screw of five feet diameter and seven feet pitoh. The Central City is a paddle-wheel boat.

The Baxter consnmed 830 pounds of hard coal, and her rnnning time between Syracuse and Utioa was 18 hours and 3 minutes. Average speed, one mile in 19 19-56 minutes, or a fraction over three miles per honr. The Port Byron consumed 4,450 pounds of coal; the Central City, 7,280 ponnds; the Newman, 4,500 pounds; the Pope, 4,354 pounds. When the records were compared at Utica, after the test, insinuations were made that the quantity of coal reported burned by the Baxter was misrepreeented. The boats, according to a new set of figures, were reported to have consumed coal as follows: Baxter, 835 pounds; Port Byron, 4,450 pounds; Central City, 7,280 pounds; Newman 4,500 pounds; Pope 2,520 pounds.

Commissioners Geddes and Chapman, together with Engineer Greene, determined to proceed with the Baxter to St. Johnsville, 34 miles, and personally take notes of the trip. The Baxter left Utica at 6:50 P. M., Thursday, and at 10 Friday morning wae at St. Johnsville. Her average speed was a small fraction over three miles per hour, and her consnmption of coal 617 pounds. Thus the correctness of her record between Syracnse and Utica was established.

The owners of the Baxter express their belief that with some further alterations she can be made to comply with all the conditions imposed by the Legislature, and this trial is considered to have demonstrated her superiority. —*N. Y. Tribune, Oct.* 23.

The Diamond Tunnel.

This tunnel has been driven up to Oct. 15th, 275 feet, representing an average rate of progress since the commencement of the work in January of this year, of about thirty feet per month. The section of the bore is seven by eight feet, and the rock passed through has consisted largely of very tough material, in places extremely so, so that the advancement made has been remarkably rapid, in consideration of the fact that no cutting machinery has been employed except the ordinary hand drill. As the work went on, a wooden tramway, sheathed with iron, was lsid along the west side, leaving ample room for a second track as soon as it will be found necessary. The mouth of the tunnel is timbered solidly, nine feet wide in the clear, and all the necessary outhouses erected for the steady and rapid pushing of the work.

The tunnel bears north 20° west, directly into the nest of veins in Cherokee Gnlch that have produced so heavily during the past two years, and are generally considered as among the most valuable that have been opened in the district. The most important of these are the Baxter, Morse, Antelope, Hikes, Laura Dale, Dives, Eagle Bird, Pelican, Corry City, Silver Plume and Pay Rock. These mines have, since their discovery, produced about one million and a half dollars, two-tbirds of which represents the yield of the last two years, during wbich time several of them have been energetically and continuously worked. The most noted of the number is the Pelicau, from which nearly $700,000 has been taken siuce tbe spring of 1871. The deepest workings upon this vein are now 400 feet below the surface, at which point ore has been found in larger and more continuous seams than near the snrface, and at the same time the prospect for meeting with good mineral at still deeper points is very encouraging. The Dives, another of the most prominent veins of the belt, has produced in the neighborhood of $100,000, and is at present yielding as good ore as has ever come out of the miue.

The course of the Diamond Tnnnel will carry it a little west of the center of this belt, and at a distance of not more than 1,200 feet from its mouth, it will intersect every one in the above list at a depth varying from 200 to 1,000 feet. The Pelicau, according to survey, will be opened 640 feet from the surface; the Dives 450 feet; the east Eagle Bird 350 feet; and the Corry City 1,000 feet. The latter is a gigantic fissure upon which comparatively little work has been done.

When the mineral deposits of Sherman and Republican Mountains are opened at these deptbs by the tunnel, there is every reason to expect that very large bodies of ore will rapidly return the money expended in reaching them. The enterprise is one of the prominent ones of Griffith District, not only on account of the extensive belt of lodes that will be tapped, but by reason of the saving in mining expenses that will be realized by working the veius from below instead of above. So long as the preeent high prices for the treatment of onr ores continue, the reduction in the cost of breaking and transporting a ton, where no hoisting or drainage is required, will add a large percentsge to the available amount of mineral that can be profitably produced by the mines.—*Colorado Mining Review.*

Coin in Circulation.—According to the annual report of the Director of the Mint, the whole amount of gold coined in the conntry is estimated at $135,000,000, and the amount of silver coin at $5,000,000. This in circulation principally in California, Oregon, Nevada, Idaho, Arizona and Texas. As the report closes with the year ending June 30th, no acconnt could be taken of the increase of coin since that dste. Five millions of silver is rather a small snm for displacing forty millions of fractional currency. It is possible that there has been an increase of gold and silver coin since the end of Jnne, of teu millions, bringing the specie resources np to $150,000,000. This is the best showing that can be made in contrast with the great volume of paper cnrrency.—*Bulletin.*

In the gulf of California a vast field of national riches has been discovered. Formerly Carmen Island alone was famons for its salt, but now other Islands are known with equally rich deposits. The Island of Santa Rosa contains an enormous field of phosphate of lime, of which a few cargoes were shipped to San Francisco, and which has now become the property of a German company. Also another guano island has been found, and rich copper mines all along the western coast. If the report speaks true the island of Tiburones is the richest of all, but the wild Indians do not permit any white settlement.

The Bessemer saloon steamer, which it is expected will secure passengers from the oscillation which produces sea-sickuess, is rapidly approaching completion in England.

Mining Interests at Robinson.

A recent trip to Mineral City places us in possession of many points of interest connected with the prosperity of that camp. Although the first trial of the Watson Company's mill resulted in a partial failure as far as working the ores from the Hayes Company's mine, still, by the determined energy displayed by Superintendent D. T. Elmore, assisted by Thomas Cahill, of the Hayes Company, a success is now guaranteed beyond a doubt. As soon as possible the mill will be started on ores now being hanled, and make a loug and successful run. The various mines now being worked throughout the district are all looking well and give promise of great richuess. Particularly is this the case with the mines of the Ward Ellis incorporation, which have, dnring the last week, developed large bodies of ore for a distance of some 750 feet on the vein. The outcrop on this valuable ledge is certainly the most remarkable since the early days of the Hidden Treasure in this district. Mr. Ward, the Superintendent of the Ward Ellis, courteonsly escorted us over his property, and exhibited to us some seventy or eighty tons of first-class milling rock, assaying as high as $250 per ton. Several large bouldere lying loose on the surface have been broken up and prove to be considerable in value, assayiug as high as $220 per ton. There are many hundred tons in sight on the mines of this company, which will be extracted at once and sent to the Watson mill for reduction, all being free milling ore with no trace of base in its composition. The mill of the Watson Company is one of the best in the State, being roomy and well arranged in all its departments. Care has been taken to leave room sufficient to allow more stamps to be placed in position should the demands of the country be sufficient to warrant the same. We are informed by Superintendent Elmore that the mill will be set in motion as soon as arrangements can be made to do so, which will be in a few days. Rumors are rife that the Canton Mining Company intend erecting a mill on their property during the sesson, with which to reduce their ores. The mines of the latter company are extensivo and show large amounts of ore, but have heretofore been found too refractory for smelting purposes. Naturally the csmp looks and is dull at present, bnt, in our mind, it is only a question of very short time, when the hopes of interested parties will be realized, and a flonrishing town stand where now are but a few houses. Great credit must be accorded the enterprising parties who have labored so hard to bring forward the really meritorious interests of Robinson District, and all will agree in hoping that the many disappointments which have been encountered, may soon be overcome, and a rich reward accrue to them. In future issues we inteud giving more extended descriptions of the numerous interests embraced in this promising camp.—*White Pine News.*

Quicksilver in Colusa County.

The *Independent*, of October 30th, has this local intelligence:

Onr correspondent from Snlphnr Springs furnishes ns with something new concerning the quicksilver mines in tbat part of the conntry. The Buckeye claim is still rnnniug with unparalleled success. The new retorts are now finished, and in a few days will be ready for reducing ore. The Abbott mine is still running, but in consequence of their retorts being out of repair are not redncing auy ore. Chapin & Co's mine, heretofore spoken of by our correspondent, is now being thoroughly developed. Tbe Empire mine, nnder the control of Van Winkle and Pardue, superintended by Captain Riddle, is progressing rather unfavorably in consequence of the lack of competent miners. Miners are mnch needed here at present. He also informs us that James Dalton and Tarton Smith have tsken up an extension on the Empire mine which shows a very good prospect. This party intend to work the same as soon as practicable.

Jackson, of the freight office, informs ns that an average of ten flasks of quicksilver a week, of uinety pounds each, are shipped below. Yesterday, nine flasks were received from the Buckeye. When the machinery shall have arrived and work fairly begun in onr mines, we expect to chronicle much larger shipments from this point. These mines will do much toward the development and settling up of our foot-hille, and we would not be surprised at any time to hear of copper being fonnd in paying quantities. Silver, too, is known to exist in well defined ledges.

Peruvian Mines.—From Peru comes the news that an important company has been formed to work the submerged mines of Cerro de Pasco. In 1840 these deposits prodnced 307,213 marks of silver, in 1872 only 201,067 marks; the striking difference is owing to the existing impossibility of reaching the veins, they being covered in places with water many feet in depth. The company will perforate tunnels leadiug ont from the bottom of tbe shafts, and the prize will be rich in the extreme. A few years since powerful engines were brought from England to pump out this accumulated water, but from unforseen difficulties only a partial success was obtained. The most expert mineralogists state as their opinion that the mines are inexhanstible.

Useful Information.

Keep Ammonia in the House.

No housekeeper should be without a bottle of spirits of ammenis, for besides its medical valus, it is invalnable for household purpuses. It is nearly as ueefnl as soap, and its cheapness brings it withiu tbe reach of all. Put a teaspoonful of ammonia to a qnart of warm soap suds, dip iu a flannel cloth, nud wipe off ths dust and fly specks and see for yonrself how mucb labor it will save. No scrubbing will be needfnl. It will clesuse and brighten silver wonderfully; to a pint of snds mix a teaspoonful of the spirits, dip in your silver spoons, forks, etc., rnb with a brush, and polish with cbamois skius.

For washing mirrors aud windows it is very desirable; put a few drops of ammonia on a piece of paper and it will readily take off every spot ur finger mark nn the glass. It will take ont grease spots from every fabric; pnt on the ammonia nearly clear, lay blotting paper over the place and press a hot flat iron un it for a few moments. A few drops of water will clean laces and whiten them as well; also mnslins. Tben it is a most rsfreshing agent at the toilet table; a few drops in a basin of water will make a better bath than pure water, and if the skin ia oily it will remove all glossiness and disagreeable odors. Added to a foot bath it entirely absorbs all noxious smell so aften arising from tbe feet in warm weather, and nothing is better for cleaning the hair from dandrnff and dnst. For cleaning hair and nail brushes it is eqnally good.

Put a teaspoonful of ammonia into one pint of water, and shake the brushes through the water. When they look white rinse them in water and put them in the sunshine, or iu a warm place to dry. The dirtiest brushes will come out of this bath white and clean. For medicinal purposes ammonia is always nnrivaled. For the headache it is a desirable stimulant, and frequent inhaling of its pungent odors will often entirely remove catarrhal cold. Thero is no better remedy for heartburu and dyspepsia, and the aromatic spirits of ammonia is especially prepared for these troubles. Ten drops of it in a wine-glass of water are often a great relief. The spirits of ammonia can be taken in the same way but it is not as palatable.

In addition to all these uses, the effect of ammouia on vegetation is beneficial. 4f you desire roses, geraninms, fuchias, etc., to become more flourishing, you can try it upon them by adding five ur six drops to every pint of warm water that you give them, but don't repeat the dose oftener than once in fivo or six days least you stimnlate them to highly. So be sure and keep a large bottle of it in the house and have a glass stopper for it, as it is very evanescent and also injurious to corks.—*Ex.*

A Convenient Way to Measure Land.

It is frequently desirable to measure a given plot of ground or a portion of a field, and a simple method, such as the following, for which we are indebted to an exchange, will be of use to many of onr readers. Surveyors are not always at a convenient distance to attend to such little jobs; and even when they do reside in the immediate vicinity, one does not always care to incur the expense inoident to snch a small job. If the lines are already established, the plot can be measured with sufficient accuracy for all practical pnrposes by means of a neat rod-pole, made as follows: Procure a stick of pine, white-wood, basswood, or almost any other timber, one and a hsif inches square and sixteen and a half feet long. Dress each end tapering from the middle, so that the pole will be one and a half inches square at the middle and about half an inch sqnare at each end. Snch a pole will be light and quite stiff. Now, graduate one side with the marks represeuting feet and inches, and gradusts another side to indicate a surveyor's links. A pole one rod in length must be equal to twenty-five links. To divide one side correctly, let a mechanic's compass be adjusted, so that the points will divide the distance into twenty-five equal spaces or links. A line can be measured with such a pole nearly as accurately as with a surveyor's chain.

Now, then, if a person does not understand how to mnltiply chains and links, let him compute the measurement by square feet. In one acre there are 43,500 square feet. Any intelligent school boy can measure the length and the breadth of a square plot, multiply one by the other, and divide the product by 43,500, which will give the number of acres, and the numbsr of square rods representing the fraction of an acre. If it is desirable to measure a triangular plot, two sides of which lie at right angles, measure these two sides, multiply the distance in feet one by the other, and divide that product by two, which will indicate the number of sqnare feet, hy 43,500, and the qnotient will represent the number of acres.

Purification of Lubricating Oil that has been used.—The following details of a practical method for regenerating lubricating oils are given in an Austrian paper: A wooden tub, holding 63 quarts, has a faucet inserted close to the bottom, and another about four inches farther up the side. In tbis apparatus is placed seven quarts of boiling water, in which are then dissolved 4½ ounces chromate of potash, 3½ounces carbonate of soda, 3¼ onnces chlorids of calcium, and 9 ounces common salt. When all these are in solntion, 45 qnarts of the oil to be purified are let in and well stirred for five or ten minntes, after which it is lsft to rest for a week in a warm place, at the expiration of wbich time the clear pnre oil can bs drawn off through the upper stop-cock without distnrbing the impurities and cleansing fluid at the bottom.

Good Health.

Sleep.

We wondered in uur yonthful days how some men could subsist with so little sleep. We knew bakere who rose every morning at 4 A. M., uotwithstanding they went to bed at 11 P. M., and had thus only five hours' sleep nut of twenty-four. Later we uoticed that many men slept only six houre, and that thie amount of sleep was fully sufficicut for plowmen or brioklayers, or other men who had no exhaustion hut that produced by manual labor, and that the sooner he took it after his labor was over the better it was for him. But we found also that for men whose lahor is meutal, tbe stress of the work is on the brain and nervons system, and tbat for him who is tired in the evening with a day of mental application, neither early to bed or early to rise is wholesome. He needs letting dowu to the level of repose. The longer the interval between the activo use of tbe brain and his retirement to bed, the better his chance of sleep and refreshment. To him an honr's sleep after midnight is probably as good as two hours before it, and even tben his sleep will not so completely and qniokly restore him as it will his neighbor who is physically tired. He must not only go to bed later, but lie longer. His best sleep probably lies in the earlier morning hours, when all the nervous excitement has passed away, and he is in absolute rest. The fact is, that as life becomes concentrated and its pursnits more eager, short sleep and early rising become impossible. We take more sleep thau our ancestors—we take more because we want more; and men whose occupation is mainly brain-work should be careful to secure a sufficient time of rest, longer in proportion as their labor is more intense, and also longer when they grow older, as the natural wants of the system will indicate.—*Manufacturer and Builder.*

New Mode of Anministering Con-Liver Oil. Nnmerous attempts have been made to render cod-liver oil less disagresable, eitber by gelatinizing or solidifying it, but only with partial success. The system of capsules ssems to answer best; but the great objection is the number of these which must be swallowed. Now it would seem that Messrs. Carre and Lemoine have coutrived to incorporate the oil with bread. Each pound of bread contains a little more than two ounces of the oil, or five tablespoonfuls, and three ounces of milk. Small loaves are also made which contain only two tablespoonfuls, and which, together, weigh only five onnces. These loaves are beautifully white, look extremely wsll, and have hardly any taste. Both children and adults eat them very willingly. In M. Bouchut's ward, at the Children's Hospital in Paris, thirty-four small loaves are brought every morning, and are looked forward to with mnch anxiety by the children for breakfast. They have been largely used among private patients, and no one complains of any disagreeable taste. Five or six tablespoonfuls of oil may tbus be given per diem, incorporated with the bread taken with the usual food.—*Lancet.*

The Danger of Sedatives.—The *Popular Science Monthly* gives this warning on the importaut mattsr of using sedatives for the little ones: One of the great dangers attending the use of the various ssdatives employed in the nursery is that they tend to prodnce the opium-habit. These quack medicines owe their soothiug and quieting effects to the action of opium, and the infant is by them given a morbid appetite for narcotic stimulants. The offering for sale of such nostrums shonld be prohibited, as tending to the physical and moral deterioration of the race. In India mothers give to their infants sngar-pills containing opium, and the result is a languid, sensual race of hopeless debauchees. In the United States the poisonous dose is administered nnder another name; but the consequences will probably be the same.

Potatoes Prosoriben. — Several German writers npon rsces prediot that nations, far from improving, will deteriorate both in physical and mental characteristics, if potatoes become a principal article of diet. The celebrated Carl Voigt says that "the nonrishing potato does not restore the wasted tissues, but makes our proletariats physically and mentally weak." The Holland physiologist, Mulder, gives the same judgement when he declares that the excessive use of potatoes among the poorsr olasses, and coffee and tea by the higher ranks, is the canse of the indolence of nations. Leidenfrost maintains that the revolutions of the last three centuries have been cansed by the changed nourishment; the lowest workmen, in former times, ate more flesh than now, when the cheap potato forms his principal subsistence, but gives him no mnscular or nervous strength.

The Propagation of Cholera by Fruit and Water.

French *savants* are hegiuniug to look upon the theory of the propagation of cholera by invisibls germs convsyed in the air, or wster, as an established faot. M. Ch. Tellier, a French *savant*, in taking this theory as demonstrsted, makss soms suggsstions which sre worthy uf considsration. He places no great reliance upon tbe effect of antiseptics upon the air itself, their action being, to say the least, doubtfnl. Moreover, he considers the notion of the germs nnavoidably taken in respiration as comparatively innocuons, because those taken in the lungs do not reach the intestines, and becanse such as ure thus swallowed, heing taken as it were in small quantity at a time, the vitality of the system is able to resist tbeir action. in like manner as it uvercomes the action of poison taken in insignificant doses. But it is by introduction of the germs into the alimentary canal, where they find couditions altogether favorable for their rapid mnltiplication and development, that the disease is most frequently and most fatally commnnicated. Fruits are spoken of as being ospecially calculated, some by their downy covering, as the apricot or the peach, otbers by the gummy or glutinous coating whioh most of them posssss, to arrest and retain the germs carried by the air. It resnlts that one partaking of fruit freely, and without precaution, may take a considerable qnantity of the infeotious germs directly into the intestinal canal, where they are most likely to produee mischief.

M. Tellier recommends that, during the prevalence of epidemic cholera, the people be instructed to confine themselves to cooked fruits, or, if they will not deny themselves the use of raw fruits, to eat them only after carefnl washing, or, better still, the removal of the skin.

Temperature ann Labor.—The normal heat of the body being taken at 98°, fever heat commences at 100°, and the extreme limit of fever heat may be taken at 112°. Dr. Thudicnm has concluded from experiments on his own body at high temperatnres, that at a heat of 140°, no work whatever conld be carrisd on, and that at a temperature of from 130° to 140° only a very small amount of labor, and that at short periods was practicable; and, further, that human labor, daily and during ordinary periods, is limited by 100° of temperature as a fixed point, and then the air must be dry, for in moist air he did not think men could endure ordinary labor at a temperature exceeding 90°. Dr. Ssnderson has added useful testimony in detail leading to similar conclusions, observing that gymnastic exercises can be prscticed by men in high temperatures to a csrtain point, but that immediatsly the temperatnre of the body rises to 102° or 103° Fah., then all capscity for further exertion ceasss. A case in Cornwall has been instanced of the excavation of mining galleries where the air was heated by a hot spring to a temperature said to amount to 117°. Dr. Sanderson visited the mine and found the temperature to be 114½° Fah., and the total duration of each of the men's work who were then engaged was less than three hours in the twenty-four. Dr. Sanderson fixes the limit of temperature consistent with continuous healthy labor during five hours at a time at 90° Fah., bnt that even at this temperatnre the loss of working power would be very considerable.

Disinfectant.—One drachm of dry iodine, placed in a suitable open vessel in a sick-room, is said to be among the best artioles nsed for this purpose. The nsnal objection of its disagreeable odor is of minor consequence when health and life are at stake. The vapors of the iodine will discolor the ceiling or plastered walls for a time, but the color will gradnally disappear. Iodoform, used in the same way, is quite as good; and is less offensive to the sense of smell; besides, it does not discolor the walls; bnt it is more expensive than the other.

The attention of the medioal world abroad has been aroused by the new treatment of cancer, introduced in London by a Hungarian physician named Grob. He contends that cancer is not a local but a general disease; that it arises from the presence of a poison in the system; and that the knife will never cure the disesse, but only postpones its fatal effects. His remedy consists in setting np another disease—fever—nnder the infinence of which the blood poison, which canses the cancsr, is thrown off. It is said that he has made some most marvelous oures.

Beef-Tea.—Take one pound of lean fresh beef cut thin, pnt it in a jar or wide-monthed bottle, add a little salt, place it in a kettle of boiling water, to remain one hour; then strain it, and there will be a gill of pure nourishing liquid. Begin with a teaspoonfnl, and increase as the stomach will bear. This has been retained on the stomaoh when nothing else could be, and has raised the patient when other means have failed.

Mineral waters containing comparatively large amonnts of alkaline silicates have been found to be very efficacious in curing local affections of the skin. The observation was first made by Dr. Hugnes at Sail-les-Chateau Moraud, the mineral constituents of the waters of which are about four-fifths silicatss.

Domestic Economy.

Housekeeping Hints.—Never pnt a particle of soap about yonr silver if you would have it rstain its original luster. When it wants polishing, take a piece of soft leatber and whiting and rub hard. The proprister of one of the oldest silver establishments in the city of Philadslphia says that "housekespsre rnin their silver by washing it in soap suds, as it makes it look liks pewter!"

Stave lnster, when mixed with turpentine and applied in the nsual manner, is blacker, more glossy, and more durable than when mixed with any other liquid. The turpentine prevents rnst, and when put on an old rusty stove, will make it look as well as now.

To extract ink from cotton, silk and woolen goods, satnrate the spots with spirits of turpentine, and let it remain several hours; then rub it between the hands. It will crumble away without injnring either the color or texture of the article.

Economical Use of Nutmegs.—If a person begins to grate a nutmeg at the stalk end, it will prove hollow throughout; whereas the same nutmeg, grated at the other end, would have proved sound and solid to the last. This circnmstance may thus be accounted for: The centèr of a nntmeg consists of a number of fibers issning from the stalk and its continnation through the center of the fruit, the other ends of which fibers, though closely surrounded and pressed by the fruit, do not adhere to it. When the stalk is grated away, these fibers, having lost their hold, grsdnally drop out in snccession, and the hollow continues throngh the whole nnt. By beginning at the contrary end, the fibers above mentioned are grated off at their core end, with the surrounding fruit, and do not drop out and cause a hole.

Pickled Cauliflowers.—Take good white heads, break them into small pieces and boil for ten minutes in strong salt and water. Skim out the pieces, which should be so tender that a splint of broom corn can be run through the stems. Lay them on a towel to drain off the water, and when thoroughly cold pnt them into a pickle jar, with a few whole cloves, allspice, pepper, and sticks of cinnamon tied up in a oloth. Boil and skim thoronghly; then put it directly over the cauliflowers. If a few beets are sliced up in the vinegar while boiling, they will color the cauliflower stalks a bright coral red, and make them more attractive to the eye. —*Country Gentleman.*

A Nice Omelet.—Beat two eggs, yolks and whites together, in a bowl until very light. In a cup put one tablespoonful of corn starch; add slowly a half teaspoonful of milk (new milk is best); when well stirred and smooth, pour this over the eggs, and beat them all well together for a few minutes; a little chopped parsley can be addsd if wished. Cook as other omelets. In making any kiud of omelet, salt and pepper should not be added until sent to table; and to have them perfectly light and tender, the ingredients must be well and quickly beaten with the fork.

Cream Pie.—For the inside, one egg, one-half cup of sugar, one-fourth cup of flour; beat well, stir into one-half pint of boiling milk and let it just come to a boil again; stir it while on the stove, then set away to cool; make the crust the same as for other pies and line a plate, spread some lard or butter on the top, and then put on another crust and bake; when done and nearly cold, take off the top crust and put the cream into the lower one; then put the top one over the cream. A little essence of lemon may be stirred into the cream just before it is pnt into the crust.

To Bleach Cotton.—A very good way to bleach cotton cloth is to soak it in buttermilk for a few days. Another way is to make a good suds, put from one to two tablespoonfuls of tnrpentine into it, before pntting the clothes in. Wash as nsual, wringing the clothes from the boil, and drying without rinsing. By using one tablespoonfnl of turpentine in the first suds on washing days, it will save half the labor of rubbing, and the clothes will never become yellow, but will remain a pure white.

Boiled Bread Pudding.—Crumb yonr stale bread in a pndding pail and oover with sweet milk, and set by the stove to warm and soften. Then to every quart of the mixture add two well-beaten eggs, a cup of sugar, and a handfnl of raisins or sweet dried fruit of any kind. Do not have your pail fnll, as it needs some room to rise. Pnt the cover on tightly, set it in boiling water and do not allow it to stop boiling till done. If you try that once yon will never make a baked pudding again. Serve with cream.

Soap.—A young lady who makes all the family soap gives the following recipe for a good cheap article: "Add to ten quarts of water six ponnds of quicklime (shell lime is best,) and six pounds of common washing soda. Put all together, and boil for half an hour, and let it stand all night to clear. Draw off the lye, and add to it one pound of common rosin, and seven pounds of fat (auy fat will do). Boil thns for half an honr, tben let it stand till oool, and cut it into bars."

SURVEYING MINING CLAIMS.—Information hsa reached the General Land Office that deputies, on surveying mining clsime, are in the habit of following the directioue of parties in intereet instesd of adhering to the lines estsblished in the original location of such olsims, and thus in effect makiug private instead of official eurveye. Commissioner Drummond, therefore, has issued a circular, addreesed to Surveyor-Generale throughout the couutry, emphatically diecountenancing this practice. After giving miuute direotions as to the proper method of aecertaining the boundaries of original locatioue, the Commiecioner etatee that a failure to make a record of location iu accordance with the law and regulations in force at the date of the location, will defeat the claim, aud if it ie uot made with such definiteness aa to operate as notice to all pereons seeking to acquire rights to mining lande, it will he void, for uncertainty.

New Incorporations.

The following companies have filed certificates of incorporation in the Oounty Clerk's Office, San Francisco:

NORTHERLY FIVE CENT HILL GRAVEL M. Co.—Nov. 19. Location: El Dorado conuty. Capital stook, $2,500,000 Directo.s—F. G. Bilty, V. P. Yelmini, W. A. Cornwall, O. Marchant and W. Maywald.

RED MOUNTAIN CONSOLIDATED COPPER, QUICKSILVER AND TUNNEL M. Co.—Nov. 18. Object: To mine for copper, quicksilver, and other minerals, and to run a tunnel within the limits of the claim for the working of ledges. Trustees—George L. Bradley, T. G. Oockrill, F. L. Kreider, J. L. Armstrong and Samuel E. Oakley. Capital stock, $1,500,000, in shares of $100 each.

Meetings and Elections.

RED MOUNTAIN OONS. M. Co.—Officers:—George L. Bradley, President; J. L. Armstrong, Vice President; Frank L. Kinder, Secretary and Treasurer.

NATOMA WATER AND M. Co.—Nov. 19. Trustees—H. G. Livermore (President), John Bennett, Horatio P. Livermore (Secretary and Treasurer), William Jarvis, Oharles E. Livermore, John H. Redington and Henry T. Knight. By resolution of the stock holders the office of the Company was removed to San Francisco. The office of the Superintendent, and of the works generally, will remain at Folsom, heing conducted under direction from the San Francisco office.

Spontaneous Combustion of Hydro-Carbon Vapors.

During the years 1870, 1871 and s portion of 1872, at the Wood-Preserving Works iu this city, severel inetancee of spontaneons combustion occurred, accompanied by explosioue of hydro-carbon vspore. Mr. I. C. Woods, Manager of the worke, at the lset meeting of the California Academy of Sciences, gave the particulars of some of these accidents and a statement as to the remedy successfully applied. The hydro-csrbon vapors used for the preeervstion of wood are obtsiued by the distillstion of coal-tar. A brick pit is attached to each two stills, to hold the hot-pitch product as it runs from them. Thie pit has an opening iu the side for access aud a ventilating chimuey through which the vspors from the pitch psss off iuto the atmosphere. The opening for access to the pit is closed by an iron door. The tsr used is msde at the gae worke in thie city. The stills used have s cspacity of from 1,200 to 1,800 gallone.

In the progress of the work, the still ooutsining the cosl-tar is ruu nntil the thermometer on the top, uear the man-hole, indicstes a heat of 420° Fah., when they oesse firing. The still and contents are theu allowed to stand and cool until the thermometer indicstee a heat of from 200° to 212° Fah. At this heat the liqnid pitch is allowed to run from the etill into the pitch-pit; as it cools it becomes solid. From the time the thermometer iu the still indicstes a heat of 420° Fsh. until after the time of letting out the pitch, the corks remain open in the vapor pipe connecting the still with the wood-preserving tank.

Until April, 1872, this lettiug out of the hot pitch wae attended with danger of fire, because of the tendeuoy of its vapors to spontsneoue combustion. If runniug the still daily, such accidents wonld oocur three or four times a yesr. The vapors from the pitch in the pit ss they passed out of the ventilsting chimney, were yellow, being the vapors of the naphthslin oils contained in the coal-tar. The oombustiou would take plece after the pitch had been running freely from the stills for some minutes. It was alwaye accompsnied by an explocion, loud enough to be hesrd scross the street, and strong enough to force away the woodeu braces placed against the iron door. Piecee of timberiug iu the pitch would take fire snd burn until extinguished.

From the time the fire ie extingnished under the etills to the time of letting out the pitch, there ie alwaye an interval of fourteen hours. The furnsce of the still is alwaye closed with an iron door and clayed up. There is a strong draft np the chimney of the still. The top of the ventilating chimney of the pitch-pit is as high ae that of the fire-chimney of the etill; and there is slways a etroug draft np this chimney through the crack between the irou door and the hrick work of the pitch-pit. A pereon standing at the iron door would uot emell auy of the vapor of the pitch. The distance from the outlet of the pitch-pipe of the still to the furuace-door of the still is not less than twenty-two feet. At the time of the laet explocion, the furnace of the etill had beeu carefully examined before the pitch was let out; uo remains of fire were found there, nor was there any other fire in the hnilding. The hour wae 10 A. M., Sunday, the works not in operatiou.

This property of heated hydro-carbon vapore to spontaneously ignite after absorhing a certain quantity of atmospheric air, is not geuerally known. The remedy devised hy Mr. Wooda is aimple and complete. It consists in the introduction of a amall quantity of water into the pitch-pit while the pitoh ie running from the still. The hot pitch vaporizee the water, the yellow vapor from the chimney ia changed to white vapor, and the desired eafety ie obtained. Too mnch water must not be put into the pit at oue time, or the pitch will boil over: uot a dangeroue hut a troublesome result.

Mr. Woods had noticed that the hydro-carbon vapore would eat away in holes the seat and valvea of compositiou globe valves; and whenever thia took place, steam waa liable to leak into the wood-preaerving tank during the process of vaporizing the wood. He noticed that whenever the steam did eo leak, that the influence of the hydro-carhon on the wood was destroyed. Thie led him to try with success the experiment of the effect of ateam on the vapors of the pitch. Since April 28th, 1872, when the remedy deecribed waa first applied, not a single explosion hae occurred at the worke. The water ia applied through a half-inch iron pipe, connected with the city maina and regulated hy a cock. Mr. Woode haa reason to helieve that the vapora from a combination of coal-tar and petroleum, are more liahle to epontaneous combustion thau the vapors from coal-tar alone.

A Promising Quicksilver Mine.

The Great Western qnicksilver mine, in Lake couuty, is more than a *promising* mine, since it is turning out from 60 to 70 flasks per week. The product for this mouth will be abont 250 flasks. The furnsce used is one of Riotte & Luckhsrdt's, with modifications by G. W. Spencer. Thie furnace begau running early in September, and the product up to the 1et of thie month was 300 fissks. The furuace hss a capacity of from ten to twelve tons per 24 houre. It is provided with double sets of condeneere, of eufficient capacity to run another furuace of equal size. Coutinuoue runs are insured by hsving this double set of condensere, as oue cools while the other is iu operation. There are now shont 65 men at work at the mine.

The ore worked is uot sorted and averages three per oent. of metal. The ooet of treatment of these ores ie estimated at from $1.25 to $1.50 per tou. The oompany propose erecting two more furnsces iu the epring, materials for which are uow being takeu up to the mine. The miue is about 16 miles from Calistoga, in Lske oounty, at au altitnde above sea level of 2,200 feet. The mineral bearing matter has a width of from 30 to 50 feet, aud consiets of a serpentine and talcose formation, aseociated with chloride aud ehales, the whole mass impregnated with cinnsbar and containing ores of varions grsdes, from one per cent. to pure cinnabar. The mine hss been opened along the whole length of the location—3,000 feet—hy tunnele and drifts, and shows richer as depth ie attained.

The workings through the varioue tunnele have proved its continuity and richnees for more than 1,000 feet. The ore body hss been tapped hy eight tunnels, fonr of which are mere prospecting tunnels, thongh they can he nsed in extracting eurface ores. The entire mass or hody is permeated with veius of cinnahar of different width, but showing the remarkable festure of a uniform aud continuone widening in depth. The enpply of ore in thie miue is said to be ahundsnt, and in view of the facte that timher is procured from the company'e land for $2,50 per cord, labor ie cheap, the mine is in a convenient locatiou, and the deposit ie large, the mine is exceptionslly a good one, and it will not be long before it will stsnd on an equsl footing with the New Almsden and Redington. If we had a few more minee of thie character, worked as energetically as this one, and the ownere would be satisfied with reaeonable profits, the price of quicksilver would come down. As the owners naturally look out for No. 1, however, if they can get $1.10 for quicksilver, they will not sell for 85 cents, and all we or any one else can esy, will not make them. The only remedy would be in haviug minee enough at work to provoke competition; hut even then the owners would combine to keep up the price. It is said that the demand for the Pacific coast alone exceeds 100,000 pounde per month, exclnsive of the demand for export to Mexico, Sonth America and China. If mine owuere cau get $1.10 per pound, who can blame them for not selling for 75 or 80 cente, although it really does do great harm to the mining, or rather milling, intereste of the coast.

MINERS' STRIKE.—The Denver *News* gives the psrticulers of a miners' strike at Central lsst week. It seems that several of the mine owners of Ceutral informed their employés that nntil further notice their wages, $3 per day, wonld be reduced ou Monday, the old hande to receive $2.70, and all uew hands engaged subsequent to Monday to receive ouly $2.50. On Monday two hundred miners engaged in a strike. On Tuesday morning the atrikers appeared at the mines, and hy threats intimidated the meu who were intending to continue at work, and eo caueed a suspenaion of operationa. After dinuer, the atrikers aseemhled and formed a procesaion. Their objective point was Nevada, where the miners had not yet taken any definite stepe in the matter of the etrike. This was done in the hope of enlisting these men in their cauee, hut they failed to make any converte. Several of the Central strikers made speechea in the atreets of Nevada, but their words had no effect, and they ac on afterwarde returned to their own town. As the strikere threatened to take poesession ot tbe mines on the following day, guarda were stationed at several of the minea to prevent disturhances. No actual collisiona have as yet taken place. The *News* aaya that nearly all the men on the strike were Cornishmen, but amongst them are a few Irishmau.

DASTARDLY.—A professed attorney eende au advertisemeut to all newspapere as followe:

Abaolnte divorcea obtained from courts of different Statea for desertion, &c. No publicity required. No charge until divorce granted.

We hope no publishers on this coast will aid him in hie awindling operations and get awindled themeelvee also.

Important Decision—Infringement Case.

For a period of more than four yesrs a suit has been in progreee in tho U. S. Court, for the Southern District of Ohio, in which the firm of Leffell, Myers & Co., were plaintiffe, and Barnett & Co., defendante, the suit being brought to restrain the defeudante from infringing ou the patents of Jamee Leffell by the manufacture of what is called the "Thomss Leffell wheel." This suit has sttracted much attention, being one of the most severely contested, prolonged and complicated in the annals of pstent litigation. The defendante made a desperato attempt to break down the Leffell patents, and to this end exhansted overy possible reeource, employing the most eminent legal taleut iu the conntry, and expending in the coutest large eums of money.

The result of this attack upou the Leffell patente hss been that they were declared valid in every particular and the defendant's wheel and cbee pronounced an iufringement thereon in sll their parte. A perpetual injunction hse been issued, forhiddiug the continued infringement of the Leffell patents by the defendants' and the csse has beeu referred to a msster for assessmeut of damages to be recovered hy the firm of Leffell & Co., from the defendants.

This decisiou will give the qnietus to a number of other casee of infringemente upon the Leffell & Myere' wheel in different parts of the country. The Leffell & Myere' wheel is well known npon the Pacifio Coast. We are always plessed to see the rightful inventor and peteutee protected from the invaeiou of patent pirates who uuder the cloak of right try to eteal the rights of others.

"Abaron:" Is Hydrogen a Compound?

[Written for the PRESS.]

We regret to observe, that the transparent "*canard*," said to have been perpetrated by a Parie correspondeut of the *Turf, Field and Farm*, is finding its way into eome of our weekly journale which are devoted to the diffusion of eoientific knowledge. The story ie that Leharre, a chemist of Lyons, after a eeries of experiments, euceeded in reeolving hydrogen gss into two gaees. One of these he calle "Abaron." Ite levity ie so great that when collected in a hollow conper globe about 18 inches in diameter and the 1-12 of an inch thick, it carried the globe rapidly to the dome of the Parie Academy huilding! It hae about 9 times the elevating power of pure hydrogen, and about 25 timee that of ordinary illuminating gse; it can be prepared on a large scale at ahout donhle the coet of pure hydrogen. To account for tbe fact of thie great discovery not having fouud its way into the Scientifio Journals, we are told that Leberre'e paper was resd hefore Paris Academy of Science, June 30th, in eecret sessiou!

It ie astoniehing that the abeurdity of these statements is not apparent to every intelligent mind. None of them will bear the slightest examination. Take the cese of the copper globe: A simple calculation ehowe, that a globe of snch dimeneions and thicknees would contain more than 84 solid inches of copper; thie would weigh nearly 189,573 graius. Under etandard conditions of preesure and temperature, a ouhic inch of air weighs 0.327 of a grain; hence the weight of the air displaced by the globe would be nearly 999 graina. This latter, therefore, would the the elevating power of ench a globe when filled with a gas whose weight is nothing. In other words, the weight of the copper is nearly 190 times the greatest possihle elevating power.

Again, we are informed the elevating power of "aharon" ie about 9 timee that of pure hydrogen. It ie easy to show that thie is impoeeihle. It is known that nnder standard conditione of pressure and temperature, a *cubic foot* of air weighe about 565 graine; and a cubic foot of pure hydrogen weigha about 40 grains. Hence a balloon of one cuhic foot capacity, filled with pure hydrogen (aasuming the envelop to have no weight), would have an elevating power of 525 grains; and the same balloon, filled with a gas having infinite levity, or having no weight, would have an elevating power of only 565 graina! If the writer meana that the deneity of "abaron" ie only one-ninth of the density of pure hydrogen, then the eleveting power of such a balloon, filled with "new gae," would he about 560⅓ grains, iustead of nine times that of hydrogen, or 9x525=4,725 graine! ZETA.

We are glad that a correapondent has taken the trouble to analyze this question. Our own time is too much occupied to enter into figures on every subject which presents itself. But if "Zeta" will again read our comment, he will aee that the elur upon one of the "weekly scientific jonrnals" wae nncalled for. However, the Editor of the departmeut (aleo a "Zeta," hy the way,) is thankful for all auch commnnications.

It ie rnmored that in the conrse of his expedition to Central Africa, Sir Samnel Baker discovered gold depoeits of great richness.

Alta City, Little Cottonwood, Utah.

Mining towns, as a general thing, have the same characteristics, as far ae the nature of the buildings and the habits of the people are concerned. The only apparent differencos hetween one and another, are in matters of sizo, appearance of surrounding conntry, etc. A walk through the principal streets of some of the miuing towns on this coast, would, however, bo one of iuterest to those who have never seeu one, as they are entirely differeut from villages iu the midst of farming communities. We give on this page an illustration, showing Alta City, Little Cottonwood Cañon, Utah, a place built up within the past two years; we are indebted for the cut and description to the Utah *Mining Gazette*.

Alta is situated in the Little Cottonwood Mining District, Salt Lake county, Utah Territory. It is abont 27 miles in a southeasterly direction from Salt Lake City. For somo fifteen miles of travel from that city, it is ahont on a level with it, and you then begin to ascend for the next twelve miles, upward of 4,000 feet, through a narrow cañon, running east from Salt Lake valley, over a very rough road. Alta is a young town, built up within the last two years from four or five honses; until in Augnst this year it nnmbered 180 honses, of various sizee and etyles, from the rude elab shanty to the two story hotel, of good and handsome finish. It is snrronnded by vast monntains, rich with the precions metals, and on which hundreds of claims have been discovered, About 2,100 mining claime have heen recorded in the booke of the district, and yet new ones are being recorded every day.

The monntaine around have received names from the various mines of note, worked in them. On the eouth is the Wellington Hill, the town site running 525 feet np that hill; further west is the Peruvian or Lexington Hill; across the creek or Little Cottonwood river, and north ie the Snow Slide Hill; east of that is the Frederick Hill. East of the Frederick and north of Alta ie the Emma Hill, running further east into the Davenport Hill, which liee northeast of Alta, and above Grizzly Flat. East of Alta ie the Granite, or Patsey Marley Hill. Alta itself is 8,475 feet above the level of the eea, the altitude being taken by an aneroid in Wm. Gill Mille' etore, which ie about the center of the town; while the monntains euddenly rise to the following elevations: The Emma Hill, 10,000 feet; the Davenport, 10,500 feet, and the Bald Mountain, being sonth and west of the town, 11,000 feet. The town site runs up nearly to the offeee of the Emma mine.

On the Emma Hill, north of the city, are situated the celebrated Emma, Savage, Montezuma, North Star, Monitor and Magnet, Illinoie Tnnnel, Vallejo or South Star, Flagstaff, Last Chance and other mines of value and notoriety, which are pouriug forth their treasuree daily, to enrich the world. Indeed, the whole hill, with the Davenport Hill, would eeem to be one vast mase of ore, covered with a shallow orust, only needing a smelter proportionatoly large, to belch out more wealth than the world has ever seen. On the Wellington Hill few developments have been made except on that celebrated mine. On the Pernvian Hill is situated the Oxford and Geneva, which, although comparatively recently discovered, ie rich and valuable. This hill is, without doubt, rich with the precious ores, but has not been prospected or developed eo much as other hills. There are, however, several valuable claims there, that some day eoon will enrich their owners. The first discovery of any note iu this region is said to be the North Star, known familiarly ae the Bruner, located in 1866. At that timo the district was known as the Mountain Lake, organized as euch in 1866, and continned eo nntil August 15th, 1868, when it wae called the Little Cottonwood Mining District. Why the change was made is not so well known, except that rival claimants wanted to get the records in their own hands. At one time there were books in the hande of each recorder, and discoverers hardly knew where to record. Each recorder stated that his books were the proper ones, for the other would be removed. As Darwiu would say, the fittest prevailed. We know of partiee who lost their claims by not recording with either.

The first bnilding put np where Alta now stands, was the steam saw-mill, and the boarding-house attached, erected in 1868, by Bishop Samuel A. Woolley and Nathan Davis, of Salt Lake City. The next was a little log-cabin, which Mr. Snyder built for Mr. Nagler, in the fall of 1869, before the latter had been in the cañon, and for which he was paid the snm of $35. There were several cabins ou the side of the Emma Hill, at the mining claims. The next cabin was built by the "Miller boys," that is, those who had discovered the Miller mine, of American Fork, who enclosed and claimed a parcel of gronud. Mr. G. W. Case theu built his cabin, and claimed a pieco of laud; and he likewise erected a blacksmith's shop for Mr. Nagler, a few yards from his cabin. Nagler's cabin, which is totally demolished, stood near the center of Walker street, between Mr. Mills' store and Messrs. Street & Ralph's store.

Messrs. Shaw and Masters were the first to put np a proper building in Alta. It was used as a saloon. Mr. Mills, of Gilroy Cal. erected the first store and largest building in the place. Tho telegraph office was brought np from Central, a small place of a few houses, half a mile west of Alta. Central was afterwards pulled dowu to build up Alta, as the site of the latter was much more eligible for a town than Central, which was built on a the side of a steep hill, Alta being on a partial flat as the cut ehows. Alta now hae several storee, plenty of saloons, two or three hotele, several restaurants, lodging houses, etc.; and all the uenal claeeee of business carried on in a mining town are well represented.

The town is laid out in 116 oblong square blocke, generally 300 feet by 175; hae ten etreete running east and west, and eleven rnnning north and sonth. This laying out of the blocks was by the survey of Mr. Nagler and his friends, before referred to. He by their influeuce obtained a patent from the Patent Office at Washington for the lower eite thue laid ont eome time in the early part of this year. When it was first understood that he applied for a patent, the few citizens then in Alta eent a protest and remonetrance to Washington in 1871, and the matter eeemed almoet forgotten on the part of the citizens, who enpposed it could not be obtained, it being mineral land, and other parties having eettled down, and claimed parcels of gronnd ae well as he. On the citizene, who had greatly increased since 1871, learning that Mr. Nagler had not forgotteu the matter, if they had, but had actually by some meane obtained the patent, they were greatly incensed, and called meetings to protest against it, and to oppose or fight the patent. The citizens charged that tho patent obtained by misrepresenting it to be agricultural land, and did not state it was mineral land, and they ventured to charge Messrs. Walker Bros., who had assisted Mr. Nagler to obtain it and purchased it from him, and then formed a company to demand payment from the possessore for a government title, with obtaiuing the patent fraudulently and oppressing the squatters. Deputations were the sent to patent company to enqnire what the prices of the lots which they had made valuable were to be, and to learn the nature of the patent. They were willing to pay a small or reasonable sum to obtain a title to their lots, but if too high a price were charged they would fight the matter. Lawyers were consulted and funds promised, but the citizens became traitors to themselves and some of them purchased the title from the patentees. Very little, if anything, is said now about the matter, and most are inclined to purchase the title. They did not hang together, for want of leaders and honest meu to plead their cause.

In the year 1871 the first snow storms appeared on the 28th day of September, and increased until from twelve to fifteen feet on the level covered the whole District, and iu some places as deep as forty feet. About the last storm for that winter was on the 30th day of June, 1872, with a fall of upwards of two feet of snow. In 1872 the winter snow storms commenced on the 24th day of October, and the last snow storm, of a very few inches, ou the 30th of June, 1873. The summer season is very short, embracing only about four months, at the most, clear of snow. This is a great drawback to the prosperity of the camp, and drives away huudreds from it. Snowslidee are very frequent dnring the winter, and they have been disastrous every eeason; several teamsters and miners have been killed thereby.

The climate is cool and pleasant in Alta during the summer months, while it is unpleasantly warm in the valleye.

Alta will be unquestionably a permanent mining town. It ie impossible for it to fail now, as thero are around it for milee mining claime which will attract men of capital, and in the development of these claims thonsands will become wealthy, and Alta increase in importance and stability.

ALTA CITY, LITTLE COTTONWOOD, WITH GRIZZLY FLAT AND EMMA HILL IN THE DISTANCE.

More Quicksilver.—Two new qnicksilver deposits have been found in San Luis Obispo county, making eight now known in the county. New dovelopments are also being made in Monterey county as well as in Sonoma. The Cerro Bonita mines in Monterey, give excellent promises. The Hollister *Enterprise* says that there are upwards of sixty men employed in and about the mines, and a large quantity of cinnabar is being daily extracted therefrom. The oompany have about completed the construction of first-clase furnaces, which will greatly facilitate the process of reduction, and increase the yield proportionately. Some six or eight teame are constantly employed in transporting goods, machinery, quicksilver, etc., to and from the town of Hollister.

Academy of Sciences.

The regular semi-monthly meeting of the Californiia Academy of Sciences, was held on Monday evening last, President Davidson in the chair. The following new members were elected: L. L. Robinson, life; S. W. Williams, LL. D., of Pekin, China; Rev. W. P. Martin, Professor of the Imperial College, Pekin, China, corresponding members; T. H. Blythe, Hon. Newton Booth, M. W. Belshaw, Dr. G. H. Murdock, Colonel William Harney, William Murray, Joseph Perkins, W. H. Moore, resident members.

Donations to the Museum.

From J. N. Simpsou, a moose-skiu coat, finely made and richly ornamented with beads and ribbons; a pair of dressed seal-skin boots; and a roughly wrought bar of pure copper, all procnred from the Indians on the rivers of Northern Alaska.

From H. Hemphill, Fiddler Crab, from Lower California.

From R. E. C. Stearns, specimens of beet sugar, from the Sacramento beet sugar manufactory.

From James S. Lawson, United States Coast Survey, Olympia, W. T., a piece of vegetable wax procured from the hnlk of a Japanese junk, wrecked many years since on the south coast of the Columbia river. It had precisely the odor and appearance of unrefined beeswax.

From Commander George E. Belknap, United States steamer Tuscarora, a piece of piano wire used for six months in deep sea sonndings. Thie fine wire had been used in sonnding to depths of 2,500 fathome, but exhibite no signe of impaired strength, nor even a trace of rust. When not in nse it is kept in a eolution of carbonate of soda and sometimes in oil.

From Mrs. Captain Shelly, an ornamental string of the eea-urchin (*Echina*) shells.

From Captain Fisher, of the whaling bark Alaska, specimens of coal from Cook's Inlet. A fine quality, existing in veins from eix to eight feet in thioknees.

From William Fisher, of the Pnget Sound Telegraph Company, head of a strange fish canght at Neeah Bay, W.T. Professor Davidson stated that the fish wae an inhabitant of the deep sea, and specimens were very rarely taken.

From Captain Oliver Eldridge, an excellent impression of a fossil fish, from Sydney Station, on the Union Pacific railroad.

From S. A. L. Brannan, scorpion and nest with young, numbering about 100, procured at Panama.

Pre-Historic Records.

Professor Davidson presented photographs of strange, but beautifnl hieroglyphics, cut on wood, found on Easter Island. Thoy were received from Thomae Croft, of Papeeti, Tahiti, and were accompanied by an interesting letter from that gentleman, giving tho speculations made concerning their history. From vague traditions among the natives they are supposed to represent the written language of a pre-historic civilization. In eome past age a powerful nation is supposed to have had ite eeat on the Eaet India Islande, and to have traded with and colonized the Islande of the South Pacific. The stone idols found on Eaeter Island exhibit a refined form of art, and other relics found there go to prove that the preeent population has greatly degenerated from a previous occnpation. Professor Davidson expressed his regret that the means were not available for an exploration of Easter Island under the auspices of the Academy, as euch a search would doubtless yield valuable relics of a pre-historio civilization.

In connection with the matter of remaine, etc., Mr. McCheeney called the attention of the Academy to a conepicuons Indian mound existing near Oakland, about two and a half milee from the Broadway station, and about 300 feet from the water'e edge. It was circular in form, about 175 feet in diameter, with eidee sloping from 45 to 50 degrees, built of ehells and other debris, and wae now covered with ehrubbery. The upper eurface was somewhat hollowed.

Mr. Dameron had examined a mound near Alameda Point. He fonnd shelle and bones. The Indians used it probably as a

[Continued on Page 332.]

Railroads in Central America.

The *Official Gazette*, published at San José, Costa Rica, gives the following interesting details of the progress of the great railroad enterprise in that country.

First Division—From Simon to Pamare.

Eleven miles laid with rails ready for use, and twelve miles more prepared to receive them. The bridge of Main is finished, and the others are in way of construction—1,100 laborers at work.

Second Division—From Pamare to Angostura.

The engineers have finished the survey, and the gradiug has commenced.

Third Division—From Cartago to Angostura.

Five camps have been established on this line since February 15th, and though the rocky soil offered many difficulties, the whole track of thirteen miles to Tajardo has been graded and the rails partly laid, which will be ready as soon as the rolling stock will arrive. The buildings are constructed, the water-tank has received its water already by the new aqueduct, and a steam engine is sawing the firewood, of which 2,000 cart-loads are already prepared. Also, the telegraph line from Cartago to Tajardo has been completed since several months. Two new camps have been established, and the total number of laborers at work amounte to 1,560 men, besides 60 cartmen, who have to find their own lodgings.

Attached to this establishment are 28 ox teams, 120 mules and a number of horses, besides 26 carts. This division consists of 8 engineers, 6 clerks, 4 chiefs, 10 contractors, 100 foreign and 50 native mechanics, 360 Chinamen, and the balance native laborers. The weekly consumption of these workmen is 50 oxen, and the bakery uses from 500 to 600 pounds of flour daily. A hospital has been erected at Cartago, which received many sick people from the neighboring country, while on this road the health has generally been very good. Though not less than 1,400 people have monthly applied at the hospital, our workmen have contributed but a small proportion to this number. The only people who died at the hospital were either Chinamen or a few foreigners who arrived already in bad health.

The calculation of the engineers gives the removal of 96,237 cubic yards of earth and 49,965 cubic yards of rock, at a cost of $49,062.71½; besides the wages of laborers and the expense of carting, erecting the camps, telegraphing, etc., amounted to $38,093.71½; the hospital department took $6,881.90, and the bills for provisions were paid in the capital, the amount of which did not come to the knowledge of the engineer, who wrote the report.

The whole line to Angostura will not exceed the cost of $1,600,000.

Fourth Division—From Alajuela to Cartago.

The rails are laid from Alajuela to Quebrada del Fierro, and within fifteen days the locomotives can reach Cartago, because the bridge is nearly finished. From 250 to 300 men are working on this division. The materiale and machinery existing on this line are sufficient not only for the line to Simon, but also to Punta Arenas, where the seventh locomotive has arrived already.

History of the Work.

The railroad was commenced on the 8th of October, 1871, at Alajuela, reaching Simon on the 15th of November, which was then a complete wilderness. The difficulties were very great, and the works were commenced at the same time in the deserts of the Atlantic coast and at Alajuela, at an elevation of 3,200 feet above the Pacific, where all the materials had to be brought in carts from Punta Arenas, sixty miles. Almost everything had to be carried across the Isthmus of Panama, which expense amounted to $10, and even $23 per rail. The first locomotive arrived at Alajuela on the 9th of February, 1873, and on the 5th of March the first train had reached the bridge of Ciruelas in presence of 9,000 spectators.

On the 6th of August, 1872, Heredior was reached, (seven miles) and on the 30th of December, the train got to San José, (fourteen miles); the thirteen and a half miles thence to Cartago are nearly finished.

These 26¾ miles form the fourth division, with six iron bridges and two viaducts, making on the whole line 166 bridges nearly all finished. The work required 3,000 yards of masonry, and 1,200,000 yards of terrepleins.

The second division from Cartago to Angostura is of 26 miles, with 1,700 cubic yards of masonry and 1,500,000 cubic yards of terrepleins. One thousand men are now grading the 15 miles east of Cartago.

On the Atlantic division the first spike was driven in May, and in spite of the greatest hardships, the first locomotive made its trip on that line in July, 1872.

Future Prospects.

Since then from 14 to 16 miles of rails have been laid, and 35 miles have been graded to Pacuare, which forms the third division.

On the second division from Pacuare to Angostura, 28 miles, but little has been done yet, but the whole will be finished within the three years of the contract. With the £1,045,000 received from the Government up to date, all the material has been paid for except the iron wharf and bridges, and about one-half of the whole line is finished. If the line had not been commenced on the two points at the same time, a million of dollars might have been saved.

The whole line from ocean to ocean to the nearest point will be 160 miles, and the question only remains which will be the terminus on the Pacific, for which five different surveys have been made, viz: to Heradura, Puerto Pital, the mouth of the Rio Grands, Tinives, Caldera and Punta Arenas. The latter will most likely be the point, though the line would extend fifteen miles further.

The dimensions of the principal bridges are: Main, 250 feet; Matina, 350 feet; Madre de Dios, 160 feet; Landire, 150 feet, etc. The balance due to Mr. Meiggs, for the whole enterprise, is £553,765.19.11.

In his message to Congress on the 1st of October, President Thomas Guardia makes honorable mention of the above line, which must undoubtedly give new life to the trade of Costa Rica.

The Dayton Mine.

Yesterday morning, in company with the very efficient and gentlemanly Superintendent, N. C. Hall, we visited this mine, situated on the eastern slope of the mountain, on the west side of Gold Cañon, about half a mile below Silver City, in Lyon county. The main

Hoisting Works Building.

Is situated about 200 feet from the south end of the location; is 30x50 feet in size, with a carpenter shop 30x26 feet, and blacksmith shop 36x26 adjoining; the whole being built of the best material and in the most substantial manner possible. The hoisting is done by a neat, compact little engine of 30-horse power.

The Shaft

Has two compartments, and was sunk in solid blasting rock from the surface down; is well timbered, and is one of the best in the State. Stepping on the cage we glided in a moment smoothly and noiselessly to the

Third Station,

Or 400-foot level. Following the main west tunnel, 145 feet from the shaft, brought us to the ledge, where turn tables have been put in and a drift run in on the ore vein south some 50 feet, the entire distance being in milling ore. The ledge is very solid, requiring continual blasting. A drift has been run north on the ledge a distance of 85 feet, all the way in good ore. The ledge at this point is so very solid so that no timbering whatever will be necessary until the ore is entirely stoped out. Ascending to the

Second Station

And proceeding along the main west drift 195 feet, we again reached the ledge, which at this point is 25 feet in width of solid ore. From where the ledge was struck, a drift has been run south 112 feet, the entire distance in good ore, and a drift north 60 feet along the line of the ledge, also in fine ore, spots of which are very rich in gold.

At That Point

The direction of the drift was changed to a more westerly course until the west clay wall of the ledge was reached, along which the drift was run in a northerly course 60 feet, when it encountered a body of ore exceedingly rich in gold, 10 to 12 feet in width and which has been prospected a distance of 50 feet in length, to a point directly under a winze which is being sunk from the first level above, for the double purpose of prospecting the ledge and ventilating the lower level.

The Winze.

Is down 105 feet, following the line of the ledge, the bottom in good milling ore. A raise to connect with the winze has been started from the north drift at the second station and is up 40 feet, also in good ore, leaving only about 50 feet to run to complete the connection between the levels. Much of the rich body of ore developed in the north drift at the second station gives average assays of from $300 to $500 per ton; and choice samples run up to the tens of thousands. A sample of the fine ore taken and horned out in our presence, showed a prospect of fine gold that would bring a glitter of joy to the eyes of an old Californian.

The Company

Have about 1,000 tons of ore on their dump ready for reduction, some of which is so rich in gold that it has been necessary to employ a watchman to prevent the carrying of portions of it away. In the face of all the different drifts on the several levels blasting and digging out the ore is being prosecuted without the least fear of its giving out, and the prospects of the development of a good paying mine are excellent beyond a doubt.—*Gold Hill News.*

Mines in the U. S of Colombia.—*Los Principios de Cali*, in speaking of the Indian gold mines, says: "There have just arrived there nine Darien Indians, bringing with them gold to be made into trinkets, etc. It is to be regretted, adds this paper, that the Government of Cauca does not endeavor to find out the mines whence these Indians obtain the gold, and found a town in that region."

There are many fine ports in the Gulf inhabited only by the Indians, where a town would become the center of a large commerce. All such plans, however, are forgotten in gaining elections. It is hoped Senor Trujillo, the new President of the State, will do something towards realizing this idea.

Various miners in Antioquia have penetrated as far as "Farallonsito," the culminating point of the western Cordilleras, in the district of Quibdo, and have discovered some rich gold mines which are being worked.

Legitimate Mining.

A correspondent of the Reno *Crescent* says: Mining is a legitimate, honorable, useful and commendable business, and should command and receive the encouragement due to what now is, and of necessity must for many years continue to be the chief industry of the Pacific States. It is not only important in itself but vitalizes and stimulates every other business of the country, as agriculture, manufactures, commerce and arts. Yet practically the merchant, farmer, manufacturer and capitalist are opposed to mining, and seem to consider it detrimental to the growth, wealth and prosperity of a commonwealth! This is perhaps the natural result of the way mining affairs have been, and are now managed. Since the partial exhanstion of surface mining, the business has to a great extent fallen into the hands of sharpers and speculators, who make their money by victimizing the unwary, instead of depending upon the actual products and legitimate profits of mining. This tends to bring into discredit the name and business of mining. To create distrust and suspicion of all mining enterprises. To drive out of the business all labor and capital seeking only honest and legitimate profits; thus injuriug the country by bringing into disrepute one of its most honorable and profitable industries. Now to counteract this evil tendency and promote the industry of the country, the business of mining should receive the same attention, encouragement and fostering care as farming, stock-raising and the mechanic arts. But such is not the case. The people of California—whose sole wealth—whose very existence in the State—is the result of mining—have been holding fairs at most of the principal towns, making a vast display of agricultural and mechanical products of the State, but ignoring entirely that great industry upon which all their wealth and prosperity is founded. Of course the people of California are all learned, wise and virtuous—refined and cultivated. Her wealthy men are noted for their scholarly attainments, and a highly cultivated and refined taste in art, in literature, in everything to adorn and beautify an advanced civilization. The State is literally filled with the most profound statesmen that ever moulded the destiny of a great people. Her poets and orators are far superior to any other of either ancient or modern times. The people are honest and patriotic beyond all precedent. But with all their virtues and acquirements, is it not barely possible that they have failed to study a very old but useful science called political economy? That is a question that would bother a sage-brush philosopher.

Mining.

If the newspapers in the mining districts can be believed, the business of mining is generally in a very flourishing state. In the State of Nevada the record of big strikes and grand developments is so common as to be almost tiresome. In most of the mines on the Comstock lode everything is looking well, and some of the mines are yielding splendid ore. In eastern Nevada the mines are promising well or are engaged in fulfilling good promises heretofore made. Belmont and El Dorado South, in Nye county, are showing, according to reports, extraordinary richness. Cherry Creek will soon have an excitement of its own. In Pioche they are talking about large quantities of gold having been discovered in the Newark mine, while it is said that the Raymond & Ely mine has found another rich body of ore. White Pine promises to revive because of discoveries made in the Fay & Mobile mine, on White Pine mountain; splendid assays having been made of the ore in that mine. Robinson is claiming attention because of recent remarkable discoveries of gold, and so goes the whole of Nevada State. In California the quartz mining business seems to be in a flourishing way, and from all quarters come good accounts of paying mines. The gravel mines, of course, are safe for large returns as soon as there is water sufficient to work them. The mines of the Pacific Coast seem to be making a grand effort to furnish the precious metals, out of which coin can be made for the day of the return to specie payments all over the land. The good reports, from the mines generally, we believe to be true. We know that in Grass Valley district the mines are doing well and are promising to greatly improve.—*Grass Valley Union.*

The Man-of-War of the Future.—Lieutenant-Colonel Strange, of the English Service, describes his idea of a ship of the future:—"She shall be built solely with a view to great speed and the most perfect sea-going qualities, whether under canvas or under steam, and to render her capable of turning handily she should have twin-screw propellers. She should be not an inch larger than is necessary for these purposes and for carrying one large turreted gun mounted, with two or three spare ones in the hold in case of accident. To secure these qualities in the highest perfection she must be encumbered with either no armor at all, or, possibly, a little on her bows only. My notion is that these small ships should never act singly; we could afford to have little squadrons of them." Mr. Bessemer's anti rolling system applied to this vessel. Colonel Strange thinks a great ironclad would have no chance with it. The new ship would scarcely miss a shot; the big ship, with an angle of roll subtended 230 feet, would make a very poor score on her diminutive and active assailants. Has can hardly overrate powers of vessels like these—able to sail to their destination at high speed, thus saving their coals for fighting; dealing the blows of the heaviest ordnance with almost the precision of a light field piece; so quick in their movements and so small in their size as to be a very difficult mark for even the stationary artillery of land fortifications; vessels which, acting in concert in numbers, would represent enormous aggregate attacking force, which could only be silenced bit by bit; the loss of each one, though trifling in itself, being probably as difficult to bring about as the destruction of a much larger antagonist of the ordinary description.

Chicago Wants a Mint.

Chicago has lately discovered that it is the natural location for minting the product of our territorial mines; and, moreover, that it would be very profitable to it to do so. Therefore it will ask for the establishment of a branch of the United States Mint. The *Inter-Ocean* expresses the wishes of the city in a long article, from which we quote:

It is for the interest of the General Government to establish an mint in Chicago, and it is due to the vast mining interest of the West, both to the miners and smelters of silver ore. This city now has in operation four large silver-smelting works, while no other city in the Union has more than one, with one exception. It is already recognized as the national center for this business, which is growing rapidly. If a mint should be located where the silver and gold is produced, there is no argument that can be urged against the immediate establishment of such an institution in Chicago.

In view of the pressing demand not only of the West, but of the entire country, Senator Logan, of this State, will, at the next session of Congress, introduce a bill of the establishment of a United States mint in the city of Chicago. That such a measure is essential to the welfare and prosperity of the mining interests of the Territories cannot be doubted by any one who sees the amount of gold and silver that almost daily passes through this city from the Territories to the Mint at Philadelphia, as well as the immense amount that is shipped directly to Europe, either in ore or in bullion. It is not easy to estimate the local importance such an institution would give the city. Chicago would of necessity become the great gold and silver depository of the Government, the specie center of the nation, and would reap the benefits necessarily connected with such a position. It would also link the vast commercial interests of ten Territories with this city, and nothing would be more natural than that miners and others should buy their goods, machinery and supplies at the point where they sold their ore or received the coin produced from their bullion. It would also bring to the city a large number of the most skilled laborers and artisans that are always attached to assay and other offices connected with an institution of such magnitude and importance.

Vegetable Parchment.—A foreign scientific paper says: The common method of preparing this exceedingly useful material requires much care and experience on the part of the operator, and only gives satisfactory results when the strength of the sulphuric acid and length of the process are accurately appointed to the substances and texture of the unsized paper to be dipped. Mr. Colin Campbell has made a modification of this process, which promises many advantages. Before treating the paper with sulphuric acid, he dips it in a strong solution of alum and dries it thoroughly. When paper thus prepared is passed through concentrated sulphuric acid, it is converted into parchment paper just as before, but the presence of the alum prevents the action of the acid from being so rapid as before, and therefore renders the whole operation much more manageable. Paper which has been printed on can also be converted into vegetable parchment, if treated in this way. The author also proposes to make parchment paper in endless lengths by connecting the alum and sulphuric acid bath with the paper machine.

Crampton's Coal-Dust Furnace.—The recent trials of Crampton's new furnace at Woolwich—a furnace wherein coal dust is successfully burnt—is a notable example of the utilization of old facts. The principle of the invention is to blow a mixture of finely powdered coal and air into a fire, whereby a powerful combustion is effected. The lecture-room analogue of this is an experiment of Faraday's in which he shook up a jar of dry oxygen with charcoal dust, and while the particles of carbon were still in suspension, applied a light, when the whole jar became a source of intense light and heat, owing to the rapid combustion which ensued. Thus the plaything of one age becomes the tool of the next, and isolated scientific facts are the germs of gigantic industries. —*Iron.*

There exists a very beautiful ideal of what home should be; but, somehow, men and women have fallen into the habit of showing to the world their best side; of exerting themselves to be amiable and agreeable to people who care the least for them; while to those to whom their interest, honor and happiness are of vital concern, they display all their most unholy and disagreeable traits.

Death Valley.

A correspondent of the Sacramento *Union*, writing from the Panamint District, Inyo county, has the following in reference to a locality to which attaches such a fearful reputation.

The terrors of Death Valley have been greatly magnified, and the pictures painted of it by many correspondents have been in unjustly formidable colors. Many believed, and doubtless still believe, that there are places in Death Valley from which great quantities of poisonous gases arise, impregnating the atmosphere for great spaces with a virus sufficiently deadly in its character to strike with almost instantaneous death every living thing which comes within the circle of its influence. All this, however, is untrue, and the story—which was and may now, perchance, be accepted for truth—is without foundation. A man can ride through and over the entire valley with perfect safety, and can find water in nearly all of the cañons which debouch into the valley from its western boundary. The Panamint Mountains which inclose Death Valley on the west, are mantled with pinion pine and cedar, and further up—a little more than half way, perhaps—the mantle becomes heavier and its character changes from pinion pine and cedar to white pine and mountain mahogany. The mountains on the west of the valley, as far as the eye can reach, are quite generously timbered.

To N. C. Chunn I am indebted for much information. He informs me that Death Valley proper is about sixty miles in length, with an average width of about eight or nine miles. King, who has prospected extensively through this county indorses Chunn's statements, and I also, with the aid of a large and powerful glass, and standing at an altitude of nearly 12,000 feet when I took my observation, am strongly inclined to think that my friends are about right in their estimates. From Telescope Peak the country on the east side of Death Valley presents a singularly picturesque appearance, and it would puzzle Prof. Whitney himself to account for the strange blending and indiscriminate mixture of so many different colors and formations which nature there exhibits. The eastern side of the valley is apparently entirely destitute of timber, and but few verdant spots greets the eye. I noticed, through the medium of the glass, near the foot of the hills, and about opposite Telescope Peak, a cluster of mesquite trees, valued and precious signs, which, no matter where seen, ever give strength to the famished and thirsty mountaineer, and with renewed energy and additional strength he pushes onward, assured that water, that priceless boon, is near at hand. The Panamint Indians frequently cross Death Valley near this point, and they tell me that they can find plenty of water on the other side. About four miles south of Telescope and about half way down from the summit, towards Death Valley, are a number of strong springs of excellent water flowing from the mountain side. Death Valley, as seen from the apex of Telescope, displays a great diversity of features and variety of colors. The most prominent feature in the scene is borax, acres and acres of which dot the valley as far as the eye can reach southward, sparkling and glittering under the rays of the sun, and looking as white and immaculate as a shirt done up by the What Cheer Laundry in San Francisco. Looking forward, from Telescope Peak, the broad valley of Panamint, Mount Whitney, the undulating range of the Sierras, Walkers Pass, and many other points of interest and scenic beauty, figure conspicuously in the picture. Death Valley at some points is, I believe, considerably lower than the level of the sea.

COAL IN LINCOLN.—Colonel Wilson has for a long time been experimenting by boring for coal on the level plain on which the town of Lincoln is situated, in the western part of Placer county. A recent telegram from Lincoln explains the success of his labors. It says:

The lignite coal miners at this place have now commenced work in earnest, and are erecting costly hoisting works. The machinery is all on the ground, and also the lumber to erect a building twenty-four by sixty feet. That there is a bed of lignite coal here in large quantities is a demonstrated fact, which has been proven by boring in six different places, the holes being bored from one to three hundred feet apart, and the coal being found in each from eight to fifteen feet thick. The coal is superior to anything before discovered in this State outside of the Mount Diablo mine, which it resembles very much. It will take about two weeks to get the mine and machinery in working order.

EXTENSIVE PLACER DIGGINGS are reported as discovered upon the Gunnison, in western Colorado. This river heads in the Uucompaghre and Saguache Mountains, and flowing a little north of west, empties into the Grand but a few miles east of the western border of the Territory. The county is one very likely to be found rich in precious metals, and especially in alluvial gold. Besides the location of placers, several gold and silver-bearing veins have been discovered.—*Col. Mining Review.*

FOUR large iron steamers, sister ships, are building in Hull, England, for the mail and passenger service between Bremen and New York. They will be all large ships, the tonnage of each being 2,700 tons, builders' measurement.

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We bold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 338 Montgomery St., S. E. corner of California St., San Francisco.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY CUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barctow, M. D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & Co., Mining and Scientific Press Office, S. F.

THE NEW U. S. MINING LAWS.

The new Laws of 1872, governing the location and purchase of Placer and Quartz Mines and Agricultural Lands in Mining Districts of the U. S., printed in circular sheet, for sale at this office. Single copies, 25 cts.

[Continued from page 329.]

camping place. Pestles, mortars and old flints wsrs also found.

Ths Presidsnt stated that this is ths condition of nsarly all thss monnds, but in many, sksistons are found iu a sitting posturs.

D. J. Staplss, who came hsrs in 1849, and locatsd on ths Tuolumne river, said he had spoksn to the Indians thsrs ahout thess rsmains fonnd in the mounds. On one occasion afts thsss Indians had disd he saw thsm burisd in a mound. They wsre huried hensath the dspression on top of ths mound. This occurred within ths past twsnty-five years, and at a time when ths Indians were living on top of these mounds. The modern Indians of this coast, who wsre a notoriously indolsnt race, prsferrsd to depoeit thsir dead in ths mounde srsctsd hy thsir predscessors, as a matter of convsnience and from ths ease with which sxcavations could he mads in ths loose shslle. A numher of mounds whioh hs had examined on the uppsr Sacramento and Amsrican rivers, appsarsd to havs hssn partially thrown up with earth, and the member was of ths opinion that ths Indians designed them to raise their hrush huts ahovs the encroachmsnts of the spriug floods. Ths Prssident said that up north the Indians seldom hury their dead nsar their homes. Thsy sometimss put thsm in trses, sometimes in canoss and somstimss in ths ground. In Sitka, howsvsr, the graves are all vsry near ths homee of ths living.

Mr. Ellie callsd attention to a large mouud ou ths southsrn part of this city. He said perhaps the Indians, heing indolent, had buried thsir dsad whsre it was easisst to dig. As to ths hollows in ths csntsr, they perhaps thrsw up dust aronnd the edges to protect themselves from ths wind.

Mr. Dameron said that in early days in the Sacramsnto Vallsy thsy burned their dead. Psrhaps the mounds wsre built to kssp thsm from the floods.

Dr. Dall, of the United States Coast Survsy, who, had recsntly retnrnsd from an sxpidition to the Alsutiau Islands, gave an intsrssting dsscription of his explorations of a cavs at Unalaska, used as a hnrial place hy ths prshistoric inhahitants. The cave had hssn partially sxamined hy him last year, and his discovsries reported to the Acadsmy, hut on his return hs was surprised to find that his search had hssn quits eupsrficial. Bsnsath a laysr of ths slowly accumulating dust of centuries, in which he had prsviously found cnrions implements, he come npon a sarcophagus constructed of ths honss of ths sperm whals, and coutaining thrse skeletons in an sxcsllsnt stats of prsservation. That thsss wsrs rsmains of inhabitauts of ths islands at a remote psriod, svsry indioation wsnt to prove. Ths locations of numerous villages wsrs marked hy mors luxuriant growths of vegstation, and closer sxamination discovsrsd the ruins of their dwslings, and large deposits of ths hones of fish, which had formed their principal article of food. By sxcavating in thsss places, it was dstsrmined how ths inhabitants had progressed from ths rudest condition of savags lifs, whsn they subsistsd mainly upon shsll fish, readily procured hy ths smploymsnt of littls mors than mers animal instinct, nntil they acqnired soms degrss of skill, enahling them to capturs fish, and fiually mastsr ths grsat sperm whals. It was thsir method to attack ths whale with lancss pointsd with a peculiar kind of stone, supposed to be fatal in its effects npon ths huge animal, and after he was slain they awaited ths action of ths wavss to brlng him ashors. Dr. Dall declared that ths dsstiny of the Alsutian psople was downward, and their history had been that of a steady dscline for ths last century, and which had besn acceleratsd hy ths Amsrican occupation. Hs dsplored in indignant terms ths nsglsct of the Governmsnt, or the Alaska Commercial Company, to provids ths psople with educational facilitiss, to ths absenos of which their decline is attrihutahle.

Miscellaneous.

Mr. I. C. Woods then rsad an important papsr on ths subject of spontaneons combustion which is fully rsfsrrsd to in anothsr column. Dr. Blake's papsr on ths nickeliferous sand of Frazsr River is also givsn in this issus.

Professor Davidson rsad a letter from Professor Spsncsr E. Baird, requesting to bs furnishsd regularly with rsports of ths processdings of the Acadsmy of gensral intsrest. It is ths purposs of that distinguishsd scisntist to pnblish in ths Nsw York *Tribune* or Harpsr's *Weekly* a complete rscord of the progrsss of American scienos. Ths Prssidsnt rsmarksd that ths requsst was really a compliment to ths Acadsmy, and should rscsivs prompt consideration.

A commnuication was rscsivsd from Colonel R. S. Williamscn, Unitsd States Corps of Engineers, presenting to ths Acadsmy a complsts sst of the Unitsd States Railroad Rsports, in slevsn volumes.

Ths Prssidsnt announced that all ths details of the acceptancs of ths gift from Jamss Lick had hesn consnmmated, and ths rssolutions of ths Acadsmy had besn sngrossed and prssssnted to the gensrons donor.

The President also announced that at ths nsxt mssting of ths Academy he should present his opinions and conolnsions on ths questions governing the location of an a stronomical ob servatory.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements

Bunker Hill Quartz Mining Company—Location of works, Amador, Amador County, California. Office, No. 13 First street, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of November, 1873, an assessment (No. 12) of Ten Dollars per share was levied upon the capital stock of the Corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 13 First street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Saturday, the 20th day of December, 1873, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 12th day of January, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

WALES L. PALMER, Secretary.
Office, No. 13 First street, San Francisco, Cal. no15

Black Mountain Coal Mining Company—Principal place of business, City and County of San Francisco, State of California. Location of works, Santa Cruz County, State of California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of October, 1873, an assessment of Two and one-half Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at his office, No. 402 Montgomery street, Room No. 23, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the first day of December, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 29th day of December, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. W. H. PARSHLEY, Secretary.

Office, No. 402 Montgomery street, Room No. 23, San Francisco, Cal. no1

Buena Vista Petroleum Company.—Location of principal place of business, San Francisco, California. Location of works, Bueua Vista, Kern County, California.

Umpire Tunnel and Mining Company—

Principal place of business, No. 230 Kearny street, San Francisco, Cal. Location of works, Big Cottonwood Mining District, Salt Lake County, Utah Territory.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of October, 1873, an assessment (No. 2) of Six Cents per share was levied upon the capital stock of the corporation, payable immediately, in United States currency, to the Secretary, at the office of the company, No. 230 Kearny street, San Francisco, California, or to W. A. Beal, President.

Any stock upon which this assessment shall remain unpaid on the 24th day of November, 1873, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 15th day of December, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

P. A. EAKINS, Secretary.

Office, No. 230 Kearny street, San Francisco, Cal.

Virginia Consolidated Mining Company.

Location of principal place of business, San Francisco, State of California. Location of works, Kearsarge Mining District, Inyo County, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 13th day of October, 1873, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
R M Shuey.	7	1364	$68 20
R M Shuey.	53	151	7 55

Machinery.

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

For further particulars apply to

R. HOSKIN, Dutch Flat,

7v25-tf JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powdar, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

ATWILL & CO.'S

WESTERN MINING AGENCY,

No. 240 Montgomery street, S. E. cor. Pine, opposite Russ House, San Francisco.

Mining Stocks bought and sold. Offices in New York, Philadelphia and London. Visitors to the city invited to call and make our rooms their headquarters. Mining Companies incorporated and Working Capital furnished. Interest of Locators and Shareholders attended to. Mines registered and described. Information relative to Mines, Ores, etc., given. P. O. Box 771. oc18-1y

[MINING SUMMARY.—Continued from Page 324.]

in the bottom working finely and the sinking making excellent progress. There is no wa ter to impede sinking.

SAVAGE.—Sinking the main incline is making good headway. Prospecting the lower levels continues without change.

EMPIRE.—Still driving the east cross-cut from the main south drift on the 1,700-ft. level.

YELLOW JACKET.—Still drifting and prospecting on the lower levels.

KNICKERBOCKER.—The erection of the new hoisting and pumping machinery is making rapid progress.

AMERICAN FLAT.—The main southwest drift at the third station is still driven ahead, showing considerable improvement in the ore during the week.

DAYTON.—The winze from the first station has made connection with the up-raise from the second, giving a good circulation of air, and proving the ore body continuous from one level to the other. The main north drift at the second station, is again being driven ahead, the face in fine ore. At the point where they turn westward, to cross the ledge 60 ft. north of the main west tunnel, was made, a drift has been started directly north, the face of which is in fine ore. The main south drift on this level is still in ore of an excellent quality. The course of the main north drift, at the third level, has been changed, 115 ft. from the main tunnel, to an almost westerly course, to cross-cut the ledge and reach the west clay wall.

UTAH.—The main west drift, at the first station, is in 94 ft., the ground working very favorably, and rapid progress being made. Guides have been extended the entire length of the shaft, and the cages are now ready for operation.

JUSTICE.—The ore body recently developed in the north drift at the 300-ft. level is about 8 ft. wide, of good milling ore, and has been traced a distance of 60 ft., gradually widening to the northward. This ore is being extracted for milling at the rate of 20 tons per day. Extracting ore from the Waller-Defeat shaft, as usual.

CROWN POINT.—Daily yield 400 tons of ore. The ore breasts and stopes on the different levels are yielding finely. The middle winze from the 1,300 to the 1,400-ft. levels is still pushed steadily ahead, the bottom in fine ore. The south winze on the same level, on the line of the Belcher is down 55 ft., also in rich ore. The main south drift on the 1,400-ft. level is still driven vigorously ahead without change of interest. The main south drift on the 1,500-ft. level has been suspended on account of the intense heat until that portion already run can be enlarged and made double so as to create a circulation of air. The mills on the river are all steadily running with increased facilities for crushing the ore.

BELCHER.—Daily yield 540 tons. The main incline is down 160 ft. below the 1,300-ft level. The east drift on the same level is in from the incline, 140 ft. The winze started from the 1,300-ft. level is down 165 ft. in splendid ore. The south drift on the 1,300-ft. level is in 462 ft., still in ore. The drift at the 850-ft level is in 140 ft.

OVERMAN.—The main west drift at the 1,200 ft. level is being pushed ahead toward the ledge as rapidly as possible, the rock in the face working finely. Cross-cutting and prospecting on the 1,000-ft. level is still prosecuted with vigor.

GOULD & CURRY.—No ore is at present extracted from this mine. The explorations on the lower levels are principally directed eastward. The cross drifts on the 1,500, 1,600 and 1,700-ft. levels are being driven ahead without intermission. There is no change to report in the appearance of the ground penetrated by these cross-cuts since our last report.

DARDANELLES.—This company are about to institute a new and effective movement toward the prospecting of the southern portion of their valuable ground, by sinking their new shaft.

Idaho.

SOUTH CHARIOT.—Owyhee *Avalanche*, Nov. 8: The northern portion of this mine undoubtedly has an extensive body of ore which two levels already have reached and for which the other levels will be pushed ahead. The developments now made and in progress in this mine will, we feel confident, open up a mine second to none in camp.

RED JACKET.—The main shaft is down 180 ft. from the surface, and is still being sunk at a rapid rate. Steam hoisting machinery is now being put up on the mine. The main shaft will continue to go down, and the several veins, in close proximity to the Jacket, will be prospected in depth.

IDA ELLMORE.—A large amount of "dead work" is being done in this mine at present. A recent crushing of 27½ tons of ore from the 10th level yielded $2,479.58, being a trifle over $90 per ton.

MAHOGANY.—The shaft is down to the 8th level, and as soon as a pump can be sunk, the cross-cut will be started to tap the ledge. The 8th level drift has been run 114 feet each way from the winze, which is 240 ft. south of the shaft. The 7th level stopes continue looking well, and are yielding plenty of ore.

GOLDEN CHARIOT.—The Minnesota has been merged into and consolidated with the Golden Chariot, under which name the entire concern is now known in the Stock Board.

THE Golden Chariot keeps the Ellmore mill busy crushing its ore, and, at the same time, is doing a large amount of prospecting. The sixth level is showing a splendid 2-ft. vein [throughout. The eighth level is also going ahead on an 18-inch vein of fine milling ore. In the ninth level there is also a splendid prospect, showing a vein of 20 inches in width, that will mill at least $90 to the ton.

Colorado.

SAN JUAN MINES.—The *Mining Review* says: A rush is taking place for the San Juan mines, occasioned by the splendid showing of specimens made at the Territorial Fair. It can only be considered as a most unfortunate excitement, as those who are inside the ring and have a knowledge of ores from that district can testify. Probably some great discoveries will be made this winter, but we may also expect to hear of many disappointments, and possibly much suffering from the hold prospectors who have started out for a new country in the beginning of winter.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., November 18th, 1873.

FOR WEEK ENDING NOV. 3D, 1873.*

ARTIFICIAL CROWN FOR TEETH.—John B. Beers, S. F., Cal.

GLOVE FASTENER.—Letitia Ferris, S. F., Cal.

COMPOUND FOR CLEANING METALS.—William Z. Moore, Vallejo, Cal.

BLOW-PIPE.—John E. McClure, S. F., Cal., and Danforth H. Ainsworth, Salinas City, Cal.

TRADE-MARK.

WHISKY.—Livingston & Co., S. F., Cal.

*This patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

NOTICE TO BUILDERS.

SEALED PROPOSALS, for furnishing certain materials and constructing a portion of the Napa State Asylum Building for the insane, will be received at the office of the President of the Board, No. 204 Sutter street, San Francisco, until 12 o'clock M. of the 30th day of October, 1873.

The printed specifications and printed forms of proposals can be had on application to Messrs. Wright & Sanders, Architects, 418 California street, where plans and drawings can be seen and all further information obtained. No bids will be entertained unless made on the specified printed forms of proposals and accompanied with a certified check or bond with two or more good and sufficient sureties, in a sum equal to ten per cent. of the total sum of the tender, to be returned on the due entering into the contract by the party to whom it may be awarded, or to be forfeited if the party fails to enter into the said contract.

The Board reserves the right to reject any or all bids.

oc4-td J. F. MORSE, President of the Board.

The time for receiving the above tenders is extended until 12 o'clock M. on THURSDAY, November 20th next.

J. F. MORSE, President.

Oak-Tanned LEATHER Belting

A LARGE, FRESH STOCK just in, of Pawtucket manufacture, for California trade, HEAVY, STRONG and DURABLE. TREADWELL & CO.,
8v26-eow16p San Francisco,

NOTICE.

To Plumbers, Tinners, Metal Roofers, Type Founders, Iron Founders, Etc.

F. C. BELDEN & CO., METALLURGISTS, are now manufacturing at their works, No. 215 FIRST STREET, SAN FRANCISCO, a superior quality of

Solder Babbit Metal and Type Metal,

Which they can supply, in quantities to suit, at a MUCH LOWER PRICE than any wholesale house in this city.

F. C. BELDEN & CO.

Portable & Stationary Saw Mills.

MILLS FURNISHED AT SHORT NOTICE

At the lowest Market Prices.

HALLIDIE'S

Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freiburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, C. O. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO., Little Cottonwood, Utah. Superintendent's Office, Sept. 23, 1872.

T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully, L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,
113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE 113 and 115 Pine St.

Concentration of Ores.

There has been during the last five or six years, considerable improvement in the concentration of ores in Pribram, Bohemia, in consequence of which the very extensive self-discharging rotary tables have been entirely abandoned and replaced by Rittinger's continuous percussion tables. This contrivance consisting of two partitions, or rather two tables, on one frame, costs about $400 in Pribram. The only improvement on this machine for many years, has been the substitution of a large polished marble plate forming the bottom, on which the separation takes place. One double percussion table has two marble places 4 feet by 8 each, in an iron frame, in place of wood, which, before the adoption of the marble, was coated with vulcanized white india rubber, answering better than plain wood, but not very durable. The marble plate, is, of course, more expensive. Formerly these tables were used for concentration of sands coming from the battery and the rotary tables received the slimes. Now, since the introduction of jiggers, improved so fine that grains of from 3 to 1 *m* in size can be advantageously and better treated than on percussion tables, these latter concentrators receive only slimes, and the rotary tables are put out of work entirely.

The loss of metal, or its value, on the best tables was from 20 to 25 per cent. if operating on galena, or lead glance of common kind. This loss increased proportionately, in case the ore contained a large amount of silver fahl ore. Included in the above mentioned 20 or 25 per cent. loss, is also that part which floats out of the last tank. Concentrating on rotary tables up to 30 per cent., the loss as stated in Rittinger's work on concentration, was 19 per cent. of which 7 per cent. floated away before concentration. This loss would have been more than doubled if the concentration had been carried on to 60 per cent. Saving the floating slime which carried the 7 per cent. would influence the total loss very little at a higher concentration, as it consists of the very finest slime subjected to the heaviest loss.

The jiggers for fine sand, as at present in operation at Pribram, are explained by the accompanying disgrams.

Figure 1 shows a sectional cut across the machine, and Fig. 2 is a sectional view lengthwise. The box, four feet by six, is first separated into two independent compartments (Fig 2), the lower end of each terminating in a funnel, and each funnel box is again parted through a partition, but only in the upper part, not reaching the bottom (Fig. 1.) On one side is the sieve, *a*, and in the other partition the piston, *i*. This apartment is lined with smooth inch boards, *f*. There is room enough left between the pieton and lining to prevent a contact which would cause friction. The piston rods work on eccentrics, which are not alike in all machines, each sort of grain requiring a different lift of the pieton.

The water communicates in both partitions. The screw *g*, with the frame-work, rests on the fixed frame c, and can easily be removed. Although the machine does not require the force of even one-quarter of a horse power, it must nevertheless be firmly secured by bolts to the foundation. The valve, *d*, serves to regulate the outflow of the concentrated part, either at intervals or continuously. The area of the piston, which is six inches thick, corresponds with that of the sieve, and makes from 130 to 150 lifts per minute. It was considered that a round shape below piston and sieve would agree better with the quick motion of the water from the piston to the sieve and back, but it was found afterwards ineffective, and the present form is like that shown in Fig. 1.

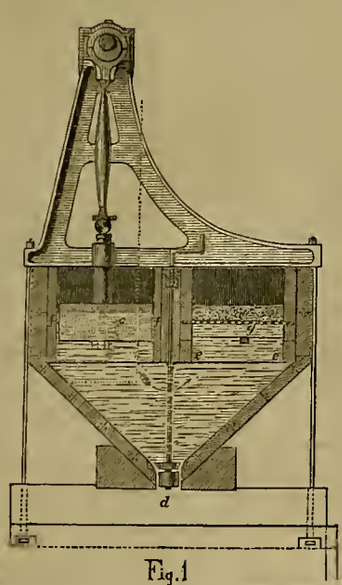

Fig. 1

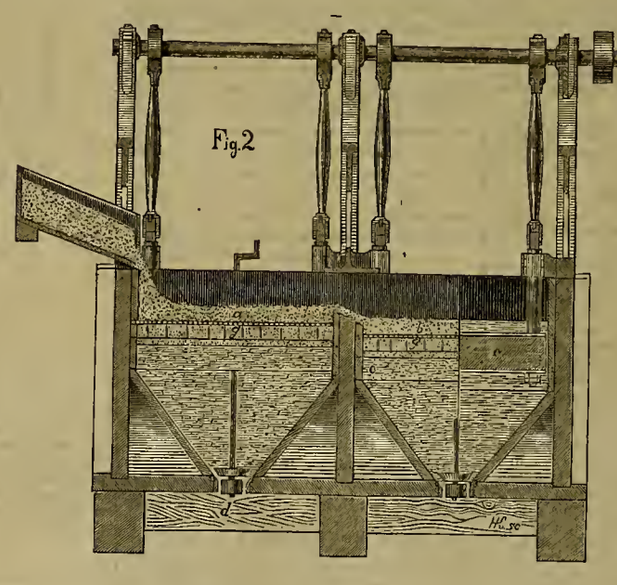

Fig. 2

CONCENTRATING JIGGER.

Retribution.

The sentence consigning the notorious "Boss Tweed" to twelve years' imprisonment is hailed with universal satisfaction by the people and press of the United States. Satisfaction at seeing men like Tweed and his associates made to feel the enormity of their offences, and gratification at knowing that the majesty of the law has prevailed. Various decisions of late, which showed that money influenced even justice, or the courts, which embody and represent justice, had made the majority of the people feel that the capitalist and the poor man were not, as they are supposed to be, equal in the eyes of the law. The decision imprisioning and fining "Boss Tweed" is, therefore, learned with a feeling akin to surprise, since the magnitude of the fortune he had stolen, was supposed to be the talisman which would influence lawyers, judges and jury in his favor.

The case has been watched with much interest, and far from being a local affair has almost become of national importance. The boldness and rapacity of the plunderers, the amounts stolen, the almost universal corruption exposed, and the facility with which it was done, have made the actions of the New York Ring known throughout the civilized world. And in this it has injured the national name. We are already called a nation of office seekers and politicians, and the name of an American abroad is coupled with the idea of money making and sharp practice. The issue of this case, therefore, involved more than a local question. Could we punish politicians for malfeasance in office? Were rich men better protected than poor ones? Could a man steal a million and go free, while the paltry offender was punished; and, "What were we going to do about it?"

These were the questions which arose in the mind of those who thought at all on the subject; and they have been answered satisfactorily. It is a good sign of the times and a suggestive one. Abuses against the government have always been treated leniently—too leniently for the good of the public morale. The higher the official the more chance of his embezzling money or perverting the duties of this office. Examples can be gathered not only from every city but every country town. Investigations are now the order of the day, but unfortunately they seldom amount to much in the end. The mere fact of their being necessary, however, is a severe commentary on the low grade of the morals of the office holder. The farmers' movement, now assuming such gigantic proportions in the land, shows that the honest men of the community think of these abuses.

The man who steals while holding offices of public trust is, in our eyes, a worse thief than he who breaks into your house at night. The former is intelligent; the latter ignorant. The public officer is placed in his position to hold in trust the money of the people and guard it against thieves. When he steals he is doubly guilty. There examples are most injurious to our young men who cannot fail to see that the men who steal most are punished least. How can we expect poor clerks to remain honest, when the leading men of their city or country are publicly denounced as dishonest, yet remain unpunished. Public opinion has heretofore treated these things too lightly, but now a revulsion has come. Dishonest men should be given the cold shoulder no matter in what circles they move, and honesty proportionately rewarded. The example of Tweed will, from its very prominence, be one that will be remembered. It will act as a wholesome safeguard against official corruption. If stealing goes on, it will never again assume such proportions, as the people will cry out against the offender, in a voice which shall influence judge and jury more than money can do. Tweed has reaped the reward due to him as the biggest thief of modern times, and the only good he has done consists in the example he has unwillingly given to the world.

Perfection in the Art of Dentistry.

Many prominent members of the dental profession deserve great praise for the efforts they have made in inventing improvements in their art, and experimenting with them until perfected. Of late years the desire among them has been to save teeth by filling, not only when decay has taken place, but also in the case of persons of mature age, when the enamel or grinding surfaces are entirely worn off. In such instances the dentine or bony structure soon shows wear and in a comparatively short time there is not much of a tooth left above the gums. This is a source of annoyance to persons in such condition. A few years ago, when a patient's teeth were worn down or broken off, recourse was had to a metallic or rubber plate, after the bad teeth had been extracted. These plates are always more or less uncomfortable and quite expensive. Now, the art of dentistry is so perfected that the teeth can be built up, or capped with gold, giving to the patient many more year's use of his natural teeth than by the old method of substitution, or employing artificial teeth.

In front fillings, where the tooth is thus built up to its natural shape, the gold must necessarily be conspicuous, and many persons naturally object to this prominent exhibition of shining gold. This objection, however, is now overcome entirely by the invention of Dr. Chas. E. Blake, dentist, of this city, which consists of a metallic enamel, so shading the natural color of the gold, that the bright yellow luster of the metal is changed or toned down, so as to blend with the color of the tooth. This process can be performed after the tooth has already been filled in the ordinary manner with gold. The coloring material can be inserted with the gold, and when finished, the blending together of the two metals skillfully will give any desired shade to the filling, to correspond with the color of any particular tooth. Of its durability there can be no doubt as the material used is platinum, a white and pure metal.

We witnessed this week, the operation of building up a tooth by the method spoken of, from which it is plain that no great amount of skill is required to produce a desirable shade by the alternate use of the two metals, one white and the other yellow. Gold foil is not used. Very thin plates of gold and platinum, alternating, are used and thoroughly incorporated together in filling. The platinum is plated with a thin covering of gold, so as to make it adhere closely. It is prepared here in sheets by Dr. Blake from the pure metal. The finished surface is perfectly hard and solid, giving a grinding face to the tooth which is very durable.

The importance of this invention will be obvious at once to the members of the profession and their patients as well.

There is in fact, a great dislike to a prominent display of bright gold in the mouth, particularly among those persons accustomed to converse much, and among public speakers, singers, actors and artists on the stage. To the latter, perfect teeth are a necessity, in order to enable them to give the proper enunciation. To exhibit a mouth full of radiant gold at the foot lights is disagreeable, as the display would readily be perceptible. Even ordinary people dislike showing their teeth, when the gold facings and fillings are thereby made prominent. Dr. Blake's patent will remedy this and will doubtless be appreciated by the public.

EASTERN VISITORS.—Our largest hotels are thronged with visitors, very many of them from the cold and stormy lands of the northern and middle Atlantic States. Every day we see them at our open fruit-stands, admiring the wonderful variety and superb excellence of our fruits; and numbers are arranging for permanent homes amongst us.

CORRESPONDENCE.

The Pioneers of El Dorado County.

EDITORS PRESS:—El Dorado county, in and abont the city of Placerville, was numbered among the most thrillingly exciting localities in California in 1849. There were few, if auy, placee in the State, so prolific in gold. For several years past, for want of proper facilities for working, the excitement that early prevailed has somewhat subsided. There is gold here in abundance, and small intereste are etill industriously worked with comparatively small returns.

Within a very few weeks a large and substantial company has been organized and bought out several small water privileges and large miniug interests. The water supply is to become greatly increased, and many hands are now employed to dig ditches for the conveyance of Silver lake and creek, with other streams, which will add very largely to the supply of water, the deficiency of which has been the great draw-back to the mining interests of this district. The consequences are that pricea of land are tending upward, and a renewal of former prosperity will, in a measure, prevail as in early timea. I have just paid a visit to

Two Quartz Mines,

One belonging to a Mr. Peter Gross, and is called the Gross Lead. It has been a source of profit to him eince laat July. He presented me with several apecimens, which exhibit considerable richness. The mine is situated abont a mile north of Placerville, in what is called Big Cañon. It is producing an average of $125 to the ton. I am credibly informed that he has been offered $16,000 for his claim, but is not disposed to sell.

The other is called the Ida Mitchell, and is owned by Messre. Mitchell & Halloway, both hard-toiling, practical and intelligent men. They have heen laboring very industriously for a long time, and at length their lahors are crowned with snccesa. This lead is iu the heart of the city, and givea very encouraging evidence of large production. They also gave me a very rich specimen. It indicates much greater richness than Gross.'

There are many persons reeiding in this town who have seen its riae and fall. They are strongly attached to the place, and pride themselves in being claasified

Among the Pioneers.

Few, indeed, have made much money, whilst many have lost large fortunee, but all are hopeful of the good time coming.

Strange aa it may seem, there are those to be found, and with whom I have conversed, who enjoy very little more than a comfortable daily support, that still see fortnue in the not far-distant future, and seem to be quite as happy in their hopeful anticipations as though they really possessed their long-sought fortnne. Such persons are very often pronounced weak. I look upon them as the strong, sturdy adventurers, through whom alone many fortunes are secured to the less adventurous and more cautious. Without thia dreamy, hopeful and restlesa spirit, which alone opens up and develops our country, to-day California would not occupy the proud and envious position of the foremoet of our new States. California'a rapid advancement and greatnes attained, challenge the civilized world, and yet she has scarcely more than reached her majority. She poseesses rare natural advantagea in mineral wealth, climate, soil, agricultural productions, the cereals, fruits, vegetables and eemi-tropical fruits, the importance of which but for the restless adventurer, to-day would acarcely be known. It is too frequently asserted that money is the great lever — the power that controls. I cannot quite enter into accord with that idea. The great power is brains, bone and sinew. These plan and execute, and money is only the representative of their force and value.

It was in this county that gold waa firet discovered, at a little town called Coloma. With the name of the adventurer, Mr. James W. Marshall,

The Discoverer of Gold,

Your readers are mostly familiar. Accidentally, to-day, I was introduced to Mr. Marshall, who, in course of conversation, gave me quite an intereating account of his experiences, after which he preeented me with a copy of his life and adventures, from which I quote the following extract:

"On the morniug of that memorable day, Jauuary 19, 1848, Marshall went out as usual, to euperintend the men employed in his mill, and after closing the fore-bay gate and thus shutting off the water, walked down the tail-race to see what eand and gravel had heen removed during the night. This had been customary with him for some time, for he had previously entertained the idea that tbere might be minerals in the mountains, and had expressed it to Colonel Sutter, his partner, who, however, only laughed at the idea. On thia occasion, having atrolled to the lower end of the race, he stood for a moment examining the mass of debris that had been washed down, and at this junctnre his eye canght the glitter of something that lay lodged in a crevice, on a riffle of soft granite, some six inches under the water. His first act was to stoop and pick up the eubstance. It was heavy, of a peculiar color, and unlike anything he had eeen in the stream before. For a few minutes he stood with it in his hand, reflecting and endeavoring to recall all that he had heard or read concerning the various minerale. After a close examination, he became eatisfied that what he held in his hand must be oue of three eubstances—mica, sulphurets of copper or gold. The weight assured him that it was not mica. Could it be sulphuret of copper? He remembered that that mineral is brittle, and that gold is malleable, and as this thought passed through his mind, he turned about, placed the specimen upon a flat stone and proceeded to test it by striking it with another. The eubstance did uot crack or flake off; it simply bent nnder the blows. Thie, then, was gold, and in thie manner was the first gold found in California."

He related a little incident to me which I do not find recorded in hie life and adventures. Before leaving the home of his parents in Hope township, Hunterdon county, New Jersey, he said he was sent out one warm spring day to perform eome duty. Seating himself in the sun, he fell into a sleep and dreamed that he would some day be the discoverer of gold. Scarcely a day from that time that he did not carry with him vieions of that kind. Dreams of gold disturbed his slumbere, and were the constaut thought ot his quiet meditations in the day, until at last the wonders of his dreams were unfolded.

Mr. Marshall possesses very little of an estate, I nnderstand. He is, however, as prond of his character as the discoverer of gold in California, as though he were a millionaire, and, indeed, more so. He is one of the kind of whom we have just been speaking. He has adventured, lahored and toiled with thousands more, whilst the few only of more cautious character have profited. His memory will live always. I. T.

Placerville, El Dorado connty, Nov. 10th.

Mining in Mexico.

EDITORS PRESS:—I have just been over to Guadulupe de Los Reyes and Tomanil. In the former district the 20-stamp mill, burned down last apring, has been overhauled, and ten stamps rigged up and running—by steam. A separate 10-atamp Bryan battery, driven by a turbine wheel, has been bnilt, and is rnnning. The mine being a long way ahead of the mills, not much work is being done here. A brilliant law suit is promised over this superb mine, the equal of any mine in the world—if it were in Nevada. It has besn in litigation for many years, and over thirty mule loads of documents (law suits) existing, and wonld take a lifetime to read over. Pronunciamentos have been gotten up over it freqnently to rob it, and a fine novel could be written about it, embracing tragedies—Popes, Kings, Presidents, etc.

It was shown to Yriarte, a poor rauchero, by an Indian. and when he got into the huge bonanza, his daughter ran off and married an English Consul. This pereon, on trifling charges, was thrown into prison by the money of the "cruel parient," who carried it from the highest churchman in Mexico to the Pope, to annul the marriage; $1,000,000 in money were presented to hia Holiness, indirectly, but failed to accomplish the end. Ruffiane were then found who entered the jail and murdered the husband; the wife then entered a convent. Several superintendente have been aasassinated, and a band of armed men are alwaya kept to defend the place. They should send to Pioche for several of its *Puros finos* at $20 per day (possession guaranteed).

Tomanil or Chapote, ia in the same mountain, but on the northeast face one-half day's ride. It was owned by Manuel Ruhio, who was lost on the Continental, off Mazatlan or Cape St. Lucas, in September, 1870. The property has been bonght in by Carrascosa and Sr. D. Vicente Laveaga, of San Francisco. The mine is in bad shape jnst now, from the had state in which it was worked, but it is a powerful mine, and will be heard from one of these daya.

San Dimas is engaging in law suits pretty extensively, a good eign of a healthy reaction.

The 10-stamp mill of Capt. Dahlgren is having a crusher added, a self feeder (copied from illustrations in the MINING ANN SCIENTIFIC PRESS), which does nicely—a large 12-foot settler and a 50-foot wheel, instead of the 24-foot one now running it, a large dryer, and aleo stacking up wood, salt, quicksilver, for a long run. A purchase was made of 100 tona of ore from the Soledad mine at $76 per *carga*, equal to $501 per ton. This wae an abandoned mine and full of water. A company of six put in $1,000 each, aud atarted to pump it ont; $11,000 haa heen so invested and $8,000 repaid by ore sold, so that only $3,000 of dead work is now actually repreaented.

The San Luis hoieting works progress. The mine can hoist 150 tone per week of $400 ore, and they are opening up more gronnd. The timber used is a hard wood and will last for 100 years in water. Fred Sundell, of Mariposa, is the engineer of the work. Henry Janin took a "flyer" in a mine, the Bolaños, but trying to exercise his San Francisco "ingenuity" (as he stylee it), was beaten by Capt. Dahlgren, and will have to retire in disgnst. This will be fully ventilated hy and by, and will eclipee his diamond fiasco, for want of judgment and lack of skill in tryiug to play "Smart Alec." Boys pleying taw have a saying "knuckle down, cheating never thrives."

We would he out of the world if it were not for your valuable eheet, but hy means of it, keep fully posted. With profonnd pleasure, we note the progress of the Sutro Tunnel, now having at leaet 5,000 feet of dead work done—*y pur si muovo*.

All I can say for this part of the world is, that for healthy climate, scenery, wood, water aud minee, thie country beats the world, and when railroads come in, all the rest will follow. I have collected some information about tunnels, and lacking more, forward what I have, and do me the favor to add what you have, and it will be of interest to your readers.

THE EXTENSIVE TUNNELS OF THE WORLD.

I have to complain of aome mean fellow who stops my MINING AND SCIENTIFIC PRESS, *Engineering and Mining Journal*, of New York, and *Reese River Reveille*, of Anstin, in Mazatlan. If they would read and forward, I would not growl, but when they try to rub it in, then I get "riled," and will see what can be done to stop it. Very truly yonrs,

VALVERNE.

On the road, San Ygnacio, Oct. 25th.

NEW CRUSHING MILL.—An ingenious substitute for Chilian mills and quicksilver tables hae been invented by Mr. Denny, of Denison Bridge, Macquarie River, and may be described as a combined hnddle and pulverizer. The machine itself ie very compact, and works with great simplicity, regularity, and ease; from the triale already made it ia believed that the machine will be exteneively adopted. The middle portiou of the vertical shaft is aquare, the bottom being turned and fitted into the center of the bottom of the discharge pan, and the top also turned to work in a bearing, having a crown wheel keyed to it. This crown wheel receivee motion from a pinion wheel keyed on the horizontal shaft, which also carries the driving pulley. On the square part of the vertical shaft a cast-iron receiver worka loose, and givea motion to the four arms which carry the rollers under which the material to be treated hae to pase. By conetructing the outer diameter of the rollers larger than the inuer the ueceesity for the usual scrapers is obviated, and the coarser stuff is alwaya driven to the center of the roller, where it ia reduced to the required degree of fineness. As a proof of the saving capacity of the machines, it is mentioned that by the time the "ailver well" ie reached all the precious metal has been extracted, for in all the cases in which tailings have been paseed through the machines no gold has paesed with the fine sand into the lower pana.—*London Mining Journal*.

FROM the 1st of April the Phœnix mine has produced some $61,000 worth of quickailver, with an average of 50 men employed.

Nevada Soda.

Among the mineral interests in which Nevada promises to become pre-eminent, there is none more important than that of the production and mannfactnre of soda. "The Nevada Soda Mine," which is located about two and a-half miles from Carson river, is the first and only miue of the kind ever discovered that producee pure carbonate of soda in any coneiderable quantities. The mine wae first discovered by emigrants when croeeing the Forty-Five Mile Desert from Humboldt Mountaiue to the Carson river. The location is at the point known as "Reg Town," where travelere were in the habit of paueing on their trans-continental journey, after from five to seven months' travel. The mine was taken up and surveyed by A. Kenyon, who afterwards sold one-half of hie claim to A. C. Scott, then Sheriff of Churchill county, in 1868. R. L. Higgins, of this city, having teeted the quality of the soda, coneidered the mine worth working, as the supply appeared to be inexhanetible. Acting upon thie impression he purchased the entire property from ite original owners, who did not consider it of very great value. Soon after, Mr. James Duffy, of Carson, became owner and partner by the purchase of one-half of the mine.

Messrs. Duffy and Higgins introduced the product of the mine into several of the mills working on the Comstock lode. By practical tcst it was found that our native aoda wae far better than any that could be procured eleewhere, and that it was of great value in the process of the reduction of ores. Soon the ntility of soda was appreciated, and large qnantities were purchaeed by the mills and mining corporatione. Shortly it waa introducod into the paper and woolen mills of California, and also into the manufactories of eoap and sal aoda on the Pacific Coast. The mine yields about 2,000 tona per year, all of whioh ia sold aa faat as it is taken out. The greatest depth attained as yet in the mine ia about forty feet, at which point a deposit has heen found of solid soda at leaat twenty feet square. At the bottom of the mine there is a never failing spring, containing about one inch of water, which will crystalize in twenty-four hours into aolid carbonate. The aituation of the mine is peculiar, it being located in a basin on the great desert, about four acres of which have sunken at least 250 feet below the level of the desert. The company working and owning the mine is now incorporated under the name of the "Nevada Soda Mining Company." The stock has never heen placed on the market for apeculation, as the owners, five in number, are contented with an ample remnneration for the practical working of the mine. It is impossible for the company with the mine at its preeent state of development, to supply the demand upon it, and aa faat as circumatancea will warrant, increased facilities for working will be procured. The bueiness of the company is rapidly increasing, and the product of the mine will before long become one of our most important ataples.—*Nevada Mining Review*.

MINT STATISTICS.—The annual report of the Director of the Mint, for the fiecal year ending June 30th, says that the amonnt of gold and silver deposits and purchases, coins struck and stamped and manufactured during the year was as follows: Deposita of gold, $59,937,429.45; Silver, $12,307,380.43. Total amount received and acted upon, $72,244,818.88. Deducting re-depoeits made and issued by one institution and deposited with another, the deposits were: Gold, $57,573,385.88; silver, $9,145,328.43—total, $66,849,714.31. Gold pieces coined, 1,824,420; value, $35,249,337.50. Silver piecea coined, 11,774,250; value, $2,945,745.50. Minor pieces, 18,925,000; value, $49,405,000. Total numher of pieces, 32,523,670; total value, $38,689,183. Bare of fine gold, $7,054,956.86; imported gold, $12,940,659.25; total, $20,495,616.11. Fine silver. $3,034,259.56; imported silver, $3,981,654.94. Total, $27,517,530.61.

The report is very voluminoue, and full of interesting statistical aud general information, and concludea as followa:

"Some idea of the increased operations may be formed when it is stated that the coinage of gold during the month of October approximated in value, $14,000,000. The coin, except as to Pacific Coast States and Territoriee, being as a general thing in the treasnry and banka, the preeent time ie a favorable one for estimating the amount of gold and eilver coin in the country. From the most reliable data obtainable, the gold coin is estimated at $135,000,000 and silver at $5,000,000; total, $140,000,000. Silver coin ia principally in circnlation in California, Idaho, Arizona, and Texaa. The increase in coin in this couutry has been at a very feir rate since the 1at of April laet, and the indications are that although there may be an occasional exportation, it will gradually go on till an amount sufficient to enable the conntry to resume specie paymente will be secured. This much desired result, however, will depend upon couditions which oannot be discussed."

FLY-TAKERS OF CAPE COLONY.—A large wisp of straw is dipped in milk aud hung hy a string to the beams of the roof; when thia ie covered with flies they come with a large bag alowly under the straw and getting it in a certain depth, shake it so that the flies are shaken to the bottom of the bag. In thie manner they sometimes take as many aa a hnahel of flies a day.

MECHANICAL PROGRESS.

Combination in Machines.

It is surprising, says our able cotemporary, the *Artisan*, when we come to analyze machine arrangements to find how much skill and inventive talent has been expended in the combination, or aggregation, of functions in machines, without adding to their efficiency, or even cheapening their cost.

The combination of several functions in a single machine presents to the unskilled the highest grade of novelty, and as all know, the distinction between novelty and utility is exceedingly difficult to understand and define. A machine that will drill, turn, mill, and so on, carries to the mind an impression of great utility, a kind of conviction that such a machine will perform all these operations at once and is equal to a drilling machine, a lathe and milling machine. Nor is this estimate by any means confined to the unskilled, as is proved by the great numbers of combination machines, both for wood and iron work, that are continually made and sold, especially in England.

In this day of dividing labor and shop processes, everything points to a division of machine function; the more a machine can be subdivided the greater the effect that may be produced; and the present wants in manufacturing machines and tools, as before said, point to "segregation" instead of "aggregation." Instead of machines to turn, bore and mill, we need machines directed not only to each operation separately, but these machines should again be subdivided into classes suited to heavy, light or special work. Combination in machines can have but few objects; the same frame may support two or more machines, but nothing is saved but the material in the framing, and sometimes floor-room; nearly always these considerations are more than balanced by a want of adaptation in the machines; that is, one function in the machine must be adapted to another, instead of to the work to be performed.

As a rule, a combined machine gives employment to but one attendant, and represents but a single machine while operating; its other functions being idle while only one is active.

Combination machines are useful in certain and exceptional cases. If one man can perform all the machine operations in a small shop, or all the irregular jobs in a large shop, and a combination machine is so arranged as to cause no loss of time in changing from one operation to another, then such a machine may be used with advantage. An illustration of this is seen in the universal milling machines generally employed in the tool rooms of our large shops. Another, and perhaps, the most important object of combination in machines is to avoid changing tools when several different operations are to be performed on one piece, and when much time is saved and accuracy secured by a combination of tool-holding appliances, or a combination of spindles that may act successively.

INCRUSTATION OF BOILERS, &c.—Of all the approbia of industrial chemistry, this is perhaps the greatest, and numerous and no less ingenious than unsuccessful have been the appliances to that end successively announced, tried, and discarded. Among the more recent are the resolvent finid, patented by Mr. Hatfull and the sand-blast, both still upon their trial. The inconvenience and positive danger occasioned by incrustation are more evident than the success of either romedy. One of the latest examples of these, as regards water-pipes, we have from Boston, where, according to the *New York Times*, the local fire insurance companies are now calling attention to the condition of the water-pipes in that city. It seems that the water supply is greatly diminished by the incrustation formed on the inside of the iron pipes by the action of the water, so that a 3-inch pipe that has been laid ten years becomes reduced to 2 inches, those of 4 inches to 3, and the 6-inch mains reduced to 5 and 4 inches. A pipe was recently taken up in Howard Street through which one could not see, though water flowed slowly; and a pipe of 3-inch bore was taken up in Beacon Street filled up solid with rust. In the suburbs cement pipes are used, but it is said that they are hardly strong enough to bear the pressure of the Cochituate water.

STEAM AS AN AUXILIARY.—The increased price of coal in England is causing the reagitation of the question of the use of steam as an auxiliary power in ships. A writer in *Iron* says: A vessel for a long voyage should be of the following dimensions:—Length, 300 feet; breadth, 40 feet, depth of hold, 24 feet, with accomodations for passengers, officers and crew on deck, and a pair of direct acting engines placed in the after part of the vessel, below the main deck, capable of working to about 150 horse-power, with boilers to maintain a steam pressure of 60 pounds per square inch. The consumption of coal would be about 72 cwt. per diem, and the speed, with a folding screw propeller, about six knots in a calm. In a sailing vessel built from my design, the best day's work was from 330 to 360 miles for nine days. It appears to be a great pity to dispense with sails, when such results can be obtained, and if a small auxiliary power were introduced as above described, into a proper proportioned vessel, it would be the most economical and effectual carrier for ocean navigation.

Invention.

After the increase in the value of labor, we have as causes of invention—first, the progress of civilization; second, the increase of trade and commerce; and third, the spread of warfare. And, strangely enough, each of these is also responsible for the advancement of the very influence upon which each has depended for its own increase, so marvellously interwoven are the relations between invention and human existence and progress. For instance, trade and commerce languished until invention furnished them with facilities. These facilities widened the lines of trade and commerce, and these again involved the necessity for added invention to keep pace with their requirements. Again, conditions of warfare stimulated the invention of new implements; and the existence of these begat a feeling of security which impelled towards conquest. Finally, invention, while satisfying old desires, created new ones, which again stimulated it to renewed effort, and thus improved instruments and conditions pushed forward civilization. We find, then, that the causes and effects of invention have been correlative, and mutually reactive, which accounts, in a measure, for its remarkable strides during the period we have named. We find, also, that invention, while directed in so many thousand different ways, and bearing upon so many thousand different results, has really tended towards but three grand conclusions to which its details have only been subsidiary. These have been the advancement of trade and commerce, signifying peace; the improved facilities for destruction, signifying war; and the progress of civilization, signifying human perfection. To these distinct and vital purposes have been devoted the labors of invention, whether directed immediately towards agriculture, mechanics, or the arts of design. From gunpowder to the electric telegraph and the sewing-machine, one portion of mankind has invented to preserve itself, while another has labored for its own destruction. The principles of good and evil, of life and death, struggling for ever, as in the old Hindoo mythology, for supremacy. To invention we owe our present advanced condition of being, and to the same element we may charge all the evils which have kept pace with it. Invention induces us to cut down forests for ship timber, and to improve our dwelling places; and the loss of these forests changes the climate of localities, and renders them, to a certain extent, uninhabitable. Invention has enabled us to live in compact and closely-constructed quarters; and this mode of living breeds pestilence, poverty and famine. Invention improves, temporarily, our modes and styles of wearing apparel, and this begets extravagance, which, in turn, brings upon us bankruptcy. Invention has increased a thousand fold the quantity and form of our food; yet there are more starving ones to-day, and food is higher priced than it was five centuries ago. Necessity is the mother of invention, and the children of invention are still—necessity.—*Builder.*

Glass Cloth.

A correspondent describing the manufacture of glass cloth at the Vienna Exposition, says: One little machine interested me, as it pertains to a new art of cloth making from glass. While in the glass exhibition, I noticed a glass case filled with silky looking articles, such as feathers, children's hats, cuffs, collars, etc. of not very tasteful styles, yet attracting some attention. Sure enough, here were the articles made of glass of which we had read so much during the last six months, also a real piece of cloth of the same material. According to promise, I endeavored to procure some of the latter for a wedding vest for a bachelor friend; but it does not seem to be for sale, being made only for a sample. The feathers were for sale, and not at all dear. I was given some specimens of the silk, and of the wool, as it is called, hanging outside of the case. The good fran told me the art was an old one from Venice, but had been lost; was now first put to practical use by her "mann," whose spinning machine was at the Machine Hall. So here, to-day, to my surprise, I found the machine, primitive as the Turk's turning table. A small boy turned the wheel having a broad rim of iron, while a girl sat with a few small glass rods before an intense jet of flame. Taking up one of these rods with one hand and melting the end in the flame, with the other she thrust a point into it, and threw a thread of glass over the wheel, much as the silk of a cocoon is started upon a reel. This was not always accomplished at one trial, but when once started it would spin off infinitely, as long as the glass rod was held in the flame. This silk upon the iron reel had the same appearance as that of one continuous web of cocoon, though not so strong. The process after this to cloth making is simple enough, and with proper machinery it may at length be made in quantity.

NEW IDEA IN ROLLERS.—A roller exhibited and tested at the Royal Society's Show just held, consists of three sections, the novelty being that the central section, instead of being on a line with the other two, is placed in front, so that it answers as a steering wheel. In the axle between the two rear sections their is a double joint, so as to admit of their adapting themselves, as they move, to irregularities of surface. The sections are made of iron, with solid sides, so that they can be filled with water if it is desired to increase their weight.

SCIENTIFIC PROGRESS.

Fruit Without Flowers.

At a meeting of the Academy of Natural Sciences, Philadelphia, Mr. Thomas Meehan presented an apple, which was borne by a tree at Kittaning, in Pennsylvania, and which tree never produced any flowers in the popular acceptation of the term; but always yielded an abundance of fruit. This specimen furnished a practical illustration of some morphological truth which could not often be demonstrated in the way this afforded the opportunity of doing. It was admitted that a fruit was a branch with its accessory leaves transformed. The apple fruit was made up of a series of whorls of leaves comprising five each. Cutting an apple through the found a series of five formed the carpels containing the seeds. Several series of whorls, very much retarded in development, probably formed the stamens, but this could not be so well seen in the apple fruit, as they seemed to be almost absorbed in the corolla series. This was the next in order that appeared in the divided apple—the green curved fibrous line which we find in all apples midway between the "core" and the "rind" is the dividing line between the series which forms the corolla and the outer series forms the calyx.

In this tree there are no pistils, the series which usually goes to make up this part of the fruit structure being either very rudimentary or entirely wanting. Hence there was no core to the fruit. The result of this want of development was that the usual calyx basin of the apple was in this case occupied by a cavity three-quartere of an inch across. There were no petals; but in place five gland or rather hud-scale-like processes, at regular distances, on the edge of the green fibrous outline before referred to. The outer whorl, which usually forms the only, was almost asepalous, as a mere scarious membrane marked the place where the calyx segments or sepals should have appeared. It was so easy in this specimen to trace the dividing line between the outer or calycine whorl and the inner or corolline whorl, which unitiag and becoming succulent, formed the popular apple fruit, that it was worthy of note in this connection. But the most interesting feature in this specimen was what were probably, from their similarity in appearance, cork cells, formed abundantly on the outside of the apple. It would seem that with the lack of development in the inner series of whorls necessary to the perfect fruit, those which remained were liable to take on somewhat the character of bark structure.

Origin of Nerve Force.

In a paper by Dr. A. H. Garrod, the following ingenious hypothesis regarding the production of nerve force is advanced. Admitting that the force in question is either identical with, or closely allied to, electricity in its properties, he then asks, where does it originate? The existence of special organs for its development in the torpedo and other creatures, which exhibit external electrical phenomena, and the absence of any such organ in man and the higher animals, would seem to indicate that the production of electricity in animals requires some other form of apparatus than the nervous ganglia. In answer to this, the Doctor seeks to show that in the difference of temperature between the interior and surface of the living body, a source of energy is presented which, on thermo-electric principles, is capable of producing all the force required. The brain and minor ganglia, he adds, would then act as offices for the reception and transmission of currents in the required directions, being in fact the commutators of the system.

In support of this, the Doctor says: "There are several of the most important phenomena exhibited by the nervous system which are very satisfactorily explained on the above hypothesis. For instance, in cold weather the impulse to action is much more powerfully felt than in summer, when the air is hot; and therefore, the temperature of the surface is higher. It is well known that it is impossible to remain for more than a very short time in a hot water bath of which the temperature is as high as, or a little higher than that of the body, on account of the faintness which is sure to come on, and this may be reasonably supposed to be the result of the cessation of the nerve-current, which is consequent on the temperature of the surface of the body becoming the same as that of the interior. This faintness is immediately recovered from by the application of a cold douche. When great muscular exertion has to be sustained, as in swimming or rowing, it is always necessary to have the clothes very thin, and it is felt during the time that it is necessary for the continuance of the effort that the surface of the body must be kept cool."

SEPARATION OF OXYGEN.—The following details of the process followed by the Oxyhydrogen Gas Company, of Buffalo, N. Y., in the production of oxygen on a commercial scale, may be of interest, though it is in general the same as the process of M. Tessie du Mothay. The treatment of the material is thus described by the *American Artisan:* The pulverized manganate of soda is introduced into iron retorts 7 ft. long, 1 ft. wide and 2 ft. deep (a cross section being an ellipse). It is here heated in a current of superheated steam. The steam passes through the mass and carries with it part of the oxygen. In ten minutes the current of steam is shut off and atmospheric air is blown in; the soda salt now re-absorbs or re-unites with the oxygen, and the nitrogen escapes. Air is passed in for ten minutes, and then steam as before. From the retorts the gas passes to the condensers, which are like the usual upright cast iron pipes used in all gasworks. Here the steam is condensed, and it washes the gas; from these the gas passes to the scrubber, where all further impurities are washed out; it then passes to the holder. It seems that the process followed is not identical with the published description of the patent. Several modifications in details have been found necessary in practice. The manganate also appears not to work to perfection, since it has been found to lose its porosity and agglomerate after being for some time in use. It is found necessary, therefore, to re-charge the retorts after a time with fresh material. Experience indicates that, could the steam be supplied perfectly dry, this difficulty might be obviated. What may be the ultimate success of the company must be left for time to decide. It is at present supplying consumers with hydrogen gas at the rate of 2.50 dols. per M., and oxygen gas at the rate of 5.00 dols. per M.

Incombustible Paper and Fire-proof Ink.

An invention has been recently patented in this country, which, if it will only stand the test, should have a wide field of usefulness. A really incombustible paper, without a fire-proof ink, would be a very valuable article in many businesses, and for many purposes of everyday life, but if it can be supplemented by a fire-proof ink, its value will be enhanced tenfold. Such a discovery Mr. G. W. Halfpenny believes he has made, and has accordingly secured his rights by obtaining the Great Seal. We gather from his specifications that the paper prepared by his process is absolutely indestructible by fire of any degree of fierceness, but that under such circumstances as fires in houses, factories, or other buildings, it is "ordinarily incombustible." The inventor prepares his paper in the usual manner, from a pulp consisting of vegetable fiber, asbestos, alum and borax, in about the following proportions: Vegetable fiber, one part; asbestos, two parts; borax, one-teuth part; and alum, two-tenths of a part. The vegetable fibers are minutely divided, and treated in the manner usual in the production of ordinary paper; the asbestos is also divided as much as possible, and the two are then intimately mixed with the alum and borax in a sufficient quantity of water to make a pulp of the requisite consistency, which is then made into paper by any of the well-known processes. The proportions given are not rigid, but may be varied to suit the quality and nature of the desired product, and also to suit the different qualities of the raw materials.

Thus, the inventor says he has made incombustible paper in which the proportions of the ingredients varied from 50 to 70 parts of asbestos, and from 30 to 50 parts of flax or other vegetable fiber, with only two and a half per cent. each of alum and borax. He proposes to use in some cases silicate of soda, in order to insure hardness and coherence in the substance of the paper after it has been acted upon by fire. In order, we presume, to obtain a paper of great strength and flexibility, the sheets may be made of linen or other woven fabric, and coated on both sides with the incombustible paper.

The fire-proof ink for use in writing or printing on the incombustible paper is made of the following substances in or about the proportions given, in apothecaries' weight: Graphite, twenty-two drachms; copal or other rosinous gum, twelve grains; sulphate of iron, two drachms; tincture of nut-galls, two drachms; and sulphate of indigo, eight drachms. These materials are mixed together and boiled in water, the graphite, of course, being reduced to an impalpable powder. This ink, which besides being fire-proof is said to be insoluble in water, under ordinary circumstances is black; but when colored inks are desired, the graphite is replaced by an earthy or mineral pigment of the desired color.

Another portion of this invention consists in the application of the incombustible paper pulp to the manufacture of covers for books and of wrappers or envelopes for parcels and packages. The inventor also utilizes talc for this purpose, singly or in combination, with his incombustible mill-board or ordinary boards. Thus the "back" of the book may consist of a number of slips of talc overlapping one another, secured to and supported by a piece of incombustible paper.—*English Mechanic.*

NEW METHOD OF PREPARING CAUSTIC SODA.—The crude lye is evaporated in cast-iron boilers. At a certain heat the cyanides contained in the pasty mass are decomposed, with escape of ammonia and decomposition of carbon. When this point is reached, the heat is raised to redness, and the mass becomes more fluid. A sheet-iron cover is then fitted upon the boiler, provided with an opening through which enters an iron pipe. This is plunged into the mass, and air is forced in. The graphite which separates rises to the surface and may be collected. The mass is tested from time to time to see if the sulphur is perfectly oxidized. When this is the case the blast is stopped, the mass allowed to become clear, and run off as usual.—*M. Helbig.*

Our Weekly Stock Review.

THURSDAY EVE. Nov. 20, 1873.

There hae been a pretty fair business done iu mining etocks during the past week, and pricee have generally ruled higher. Reports from the various mining districts are very encouraging, and a favorable eeason is anticipated. A number of new districts are being prospected, which may develop favorahly next year, but of which there are as yet conflicting reports. We note, by the way, the incorporation of a company to work the Wonder of the World ledge in the newly discovered Panament mines. If this new company intend working their mine properly and do not rely too much for profits on stock sales, the district will he materially benefitted, and attention will he drawn to it.

We note, aleo, that many of the numerous hydraulic claims in this State are starting up work again under favorable auspices. This class of prospecting is often neglected in favor of quartz, while it ie at the same time much more profitable, ae a general thing. Judging from the tone of our Englieh exchangee, hydraulic mines are greatly in favor just now in London, while no Englishmen want to touch quartz mines with a forty-foot pole. It augure well for our State that these capitalists are desirous of trying this class of proepecting, as we have plenty of it.

Among the lateet remittances received from some of our mines are $3,450 from the Mahogany, $2,388 from the Jnstice, $3,571 from the Sierra Nevada, and $23,400 from the Raymond & Ely, making a total of $91,100 from the last named for the month, and 900 ounces gold amalgam for the last week's run at the Eureka mine. The Cederberg has also received 632 ounces, or about $10,500 this week.

The Derby mine has declared a dividend of 50 cents per share.

Business in the Comstock mines has been quite lively this week, showing that confidence is felt in nearly all of them getting ore sooner or later.

Advices from the Belmont still continue favorahle.

THE SONOMA Mine in Cinnabar District, will have a 15 ton furnace running in about a month; the total cost of the machinery will be $15,000. The mine has plenty of good ore out now.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

AMADOR COUNTY.

WORK PROGRESSING.—Amador *Ledger*, Nov. 22: Work is progressing rapidly on the Amador Canal. Mr. Merriman, who has taken five miles to complete, has 175 men now employed on his contract and is pushing the work rapidly. On the three mile coutract, which will bring the canal to the river, 125 men are now employed, which force in a few days will be very materially increased. The force of carpenters that passed through Jackson a fews ago is now engaged in constructing the flume around Bald Rock. All the material necessary for construction, is being placed along the line of work as rapidly as the same is required; a force of men is engaged in cleaning out and removing all obstructions from that part of the canal heretofore finished. No work of that kind and magnitude has ever before been pushed on more rapidly or satisfactorily than is now being done on the canal under its present supervision.

STATE OF MAINE.—We learn that in running the drift from the bottom of the maiu ehaft, the workmen a few daye ago came on to a very fine quartz ledge about three feet in thickness, solid and compact, with well defined walle and all indications surrounding well formed permanent ledges. The ore not only looks fine hut prospects well. The mill belonging to the company, has been moved from its former eite to a position near the mine, and will soon he ready for crushing. We are further informed the mine never preeented a more flattering appearance than at present.

ALPINE COUNTY.

I X L.—Alpine *Chronicle*, Nov. 15: The water having been pumped out of the shaft, work has been reaumed where the heavy body of water was struck.

SILVER MOUNTAIN.—Alpine *Chronicle*, Nov. 22: Manager Chalmere has his teams busy hauling ore from the mines to his mill, preparatory to making another run before snow flies. The rock ie considered the best ever brought from the mines.

MONITOR.—The Schenectady mill has been pounding away on rock from the old dump for the past week.

N. & N. W.—The Carson river is again pouring its waters over the newly repaired dam. The structure is greatly improved in every respect.

Work is being pushed forward in the Silver Glance ahaft and tunnel. At the bottom of the ehaft the ore is looking quite promising. In the west drift there is quite an improvement in the rock. Three samplee taken from seams in the face assayed $54, $39 and $39 per ton, respectively.

CALAVERAS COUNTY.

HYDRAULICING COMMENCED.—Calaveras *Chronicle*, Nov. 22: Work has been commenced in the great hydraulic claim of Veith & Co., located in Tunnel ridge—the first "piping" of the season in this vicinity. During the summer the sluices connected with the mine have been raised twelve feet above their original position for the purpose of affording a better "dump" for the tailinge, and for working to advantage. It will give a good account of itself this winter. Other claime are in readiness to commence operatione eo soon as the water eupply will warrant it.

GARLAND'S MILL.—Garland'e new mill, at Mosquito, is in readiness to run with the exception of the lack of eteam pipe. That will be on the ground shortly, and the battery immediately set at work upon Good Hope rock.

SAN BRUNO.—Operations are heing pushed very briekly at the San Bruno mine at Mosquito

and sinking, under the superintendonce of H. G. Coward, the former owner. Mr. Hanagan, who is in charge, struck a permanent veiu of great riohness. The main shaft is down 360 feet; the vein increasing in size and richness, the ore heing of a high grade.

The Bendareta mine was formerly tho Eclipse, from which the Goodwin Brothers took out those hundreds of thonsauds. After them Peter Wynant became the owner. He too, took out large amoants, but it seems that they lost the lead and geve it up as a "petered" mine. Some time ago Mr. Wynant made an arraugement with a San Francisco company, who placed it in oharge of Mr. Hanagan. Mr. Hanagen intends starting up the mill ou Monday next, if there is a sufficiency of water.

The John L. Scanlan mine is situated on the opposite side of the river from the Bandareto. Mr. Scanlan has had several lots of ore from this mine worked, which paid a handsome profit over expenses.

There are several other old abandoned mines in the immediate neighborhood of those above mentioned, to wit: The Martin & Walling, the Cherokee and Heslop, all of which have been profitably worked—the Martin & Walling in partionlar; it was of fahulous riohness, and thore is no question of all of them proving equally as rich as those above mentioned.

The reopening of these mines has hed the effect of starting out a number of prospectors. Some of them have been rewarded with very flattering promises. Qaite a nnmber of good prospecting new veins have beeu discovered iu proximity to the above mentioned mines, and as capital eeems to be seeking investment in this particnlar region the day is not far distant when the North Fork and Gentry's Gnlch diggings will he a second Washoe.

PLACER COUNTY.

Rising Sun Mine.—Placer *Argus*, Nov. 15: This quartz mine is about two miles from Colfax, and is one of the best mines, in the county. The company is now working on the 400-ft. level, and at that depth the ledge is from eighteen inches to two feet, and the rock yields from $30 to $60 per ton. They are now sinking for the 500-ft. level and the rock continnes to grow richer as they go down. The oompany has for some time past declared a dividend of $6,000 per month from rook worked in a five atamp mill.

The Crater Mine.—*Herald*, Nov. 15: They were now down 312 feet in this mine, and at this level they had oommenced drifting each way along the ledge. At this depth the rock at the bottom of the shaft was very rich, and they find in drifting that it doea not decrease any in value. For the last hnndred and odd feet they have been sinking through $40 and $50 rock, and when tbey get their levels in and begin stoping ont this riob rock in large quantities, we shall expeot to hear of some immense olean-ups from the St. Patrick Co.'s mill.

TUOLUMNE COUNTY.

Spring Gulch Mine.—Tnolamne *Independent*, Nov. 22: This mine looks encouraging. The workmen have struck a rich chnte of ore about 18 inches in width which will pay about $500 per ton. The mill is running on half-time, owing to a scarcity of water, and doing well.

The Chapaaral.—Sitnated one mile sonth of the Bnchanan is a quartz vein called the Chaparral, and is considered by those whn are posted, as among the best. The ground is owned by Messrs. Trout, Wagner, Schultz & Co. The lead is three feet in width, and showa gold all-through the vein. In the tunnel, 150 feet from the surface, free gold is seen in the rock, and will probably pay abont $50 per ton. This vein is supposed to be a continnation of the Bnchanan.

About to Start Up.—The ten stamp mill on the Buchanan mine will start np in a few days. Sup't Tulloch has 200 tons of rock on the dump in which gold is generally disseminated, and is supposed to pay from $30 to $50 per ton. They are at present working 15 men. The lead at a depth of 175 feet is ten feet wide, and gold can he seen from one side to the other, and rock enongh in sight to keep a twenty-stamp mill running for twelve months. The company are building a ditch for water which they intend to nse for a twenty-stamp mill in the spring.

Day Arroya.- *Union Democrat*, Nov. 22: In the claim on Sullivan's Dry Arroya, the ground is paying for aluicing about ten dollars a day to the hand. The company is now working old ground that has been washed off down to the slate; upon sinking through the slate gravel was struck; the slate and gravel are hoth being run through the sluices with the above result.

Soulsby.—At the Soulsby mine, work was commenced this week, to put up the shaft and hoisting works, that were damaged hy fire a few weeks since, in good order and condition. Superintendent Johns informs us he expects to have the works completely repeired and the mine pumped out in three weeks, that the taking out of ore may he resumed at that time. When the burning out of the shaft occured the vein had just been opened where it indicated fine paying ore.

Nevada.

WASHOE DISTRICT.

Consolidaten Viroinia— Gold Hill *News*, Nov. 22: Daily yield 100 tons of ore. There is no change in the quality of the ore extracted. The ore breasts on the 1,200-ft. level are yielding fully up to the most sanguine expectations, Sinking the north winze on this level is making steady progress, though the ore in the bottom reqnires continual blasting. The qnality of the ore continues good. Sinking the south winze is also making fair progress, the quality of the ore in bottom being excellent. The main east drift on the 1,000-ft. level is being driven vigorously ahead, the ground in the face being much softer. Sinking the main shaft is making rapid progress. It is expected that opening a new station at the 1,300-ft level will be commenced abont the first of next month.

Crown Point.—About 400 tons of ore are extracted daily from the 1,000, 1,200 and 1,300-ft. levels. Tho ore is of the same character as described in previous reports. A drift on the 1,400-ft. level is being pushed forward rapidly to connect with the south winze from the 1,300, which is on the boundary line of the Crown Point and Belcher. Have not yet made connection with the middle winze on the seme level, but expect to do so hourly, thereby obtaiuing better ventilation. A donble compartment drift is heing run on the 1,500-ft. level. Work on the soutb oompartment has been stopped in order that the one north, which is designed solely for ventilation purposes, may overtake the former. A steady stream of wetor, hot enough to cook an egg in five minutes, continues to flow from this level. The pumps are taxed to their ntmoet capacity. The various breasts and stopes throughout the mine are looking splendidly, and are yielding their usual amount of excellent ore.

Belcher.—Daily yield, 500 tons. The incline from the 1,300-ft. level has been driven downward as far as the 1,400 in very hard rock. The drift from the incline on the 1,300-ft. level is in 173 feet. A drift has been extended southward from the Crown Point line, on the 1,300-ft. level, 480 feet, still in quartz. The winze starting from the same level ia down 173 ft. The winze commencing at the 1,200-ft. level is down 102 feet. Good ore fonnd all along. Abont 260 tons of ore daily are hrough up through the Yellow Jacket shaft. The mine is looking very well, and plenty of ore is in sight.

Sierra Nevada.—Sinking the new shaft is making excellent progress. The shaft in size and finish will be second to none on the Comstook lode, and shonld the ground prove favorable through which it is designed to pess, will he unexcelled by any the world. The ore developments in the old Sacramento ground on Cedar Hill, continne to improve.

Sutro.—The main drift is heing pushed rapidly ahead with no let-up night or day. Daily progress five feet. The drift is in 95 feet. Some fine looking rock has been encountered assaying from $10 to $35 per ton. The general appearance of the mine is promising and its proximity to the Utah enhances the prospective value of the mine.

Sutro Tunnel.—This great enterprise is being pushed ahead vigorously aa usual. Total length at present, 5,242 feet. Good progress is made in sinking the various shafts along the line of the tunnel.

Julia.—The water in the shaft is gradually subsiding. The main southwest drift on the 900-ft. level is making steady progress. The west cross-cut from this drift is being pushed ahead, with excellent indications of striking the main ledge.

Utah.—The main west drift from the shaft on the 400-ft. level is now advanced over 100 feet toward the ore vein. Work in this drift is carried on without cessation. Excavating for a tank in the shaft at the 400-ft. station is making good progress. Upon its completion, sinking the shaft for the 500-ft. level will be reaumed.

Justice.—Daily yield, 50 tons of ore, mostly from the third station. The raise from the main north drift on the 300-foot level to connect with the upper level is making rapid progress. The main north drift on the 400-foot level is still driven energetically ahead. Sinking the winze in the mein south drift on the 400-foot level ia making fine headway, with excellent prospects of a rich ore development soon. A crosscut from the main north drift is being run 200 feet north of the shaft, on the 400-foot level, which will soon reach the ledge.

Dayton.—The main north drift at the third level is still driven vigorously ahead, the face in fair grade ore. The main south drift on this level is still in fair grade ore, with small spots of porphyry mixed in with the ore. At the second station the main south drift continues in hard blasting ore of a fine quality.

Gould & Curry.—The several cross-cuts on the lower levels are still carried forward without intermission. There are no particularly favorable features noticeable in any of the drifts. In the old upper levels of the mine, considerable work is going on, as there is still a large area of ground at those levels remaining nnprospected.

Succoa.—This mine possesses more than nsual interest at the present time, owing to new and good ore developments. From the hottom of the small shaft in the ravine near the mill, 180 feet from the surface, the drift east at a distance of 130 feet cut the ledge, which has been followed 30 feet. It is principally gold ore, the proportion of silver being light, and gives some very rich assays. One this morning went over $13,000 to the ton, some $600 of which was silver. The ledge is about six feet wide.

Pictou.—Driving the tunnel ahead as usnal, and we are pleased to report that it has got through the hard blasting rock and is making much better progress. The company is making all necessary preparations for continuing work during winter.

Overman.—The main west drift at the 1,200-ft. level is still driven ahead, the rock working finely. The machinery of this mine is among the finest on the Comstock lode, and every thing in the best possible working condition for the approaching winter.

Hale & Norcaoss.—Sinking the mein incline is continued and setisfactory progress heing mede.

New York Consolidaten.—Sinking the shaft is making fine progress, the rock in the bottom being much softer, and the indications of striking the ledge increasing every day. The new hoilers are in place, and will be ready to steam up hy next Monday. The pump will be lowered during next week. Everything in and about the mine is in fine condition for future operations.

Chollar-Potosi.—Daily yield 150 tons of ore, the assay value of which is $40 per ton. The ore prospects in the south drift at the third station still continue excellent. Tbe ore breasts and stopes in the Belvidere and other portions of the ore-producing sections are all looking and yielding finely. Another mill, the Empire State, has just been started up, crushing ore from the mine.

Savage.—Sinking the mein incline is making somewhat better progress, the rock in tbe bottom not being so hard to hlest. It is now down 250 ft. below the 1,700-ft. level.

Arizona, Utah and Globe.—Tbe face of the main west drift at the 400-ft. level has greatly improved in appearances since our last report, and promises some fine ore developments before long. There is also an improvement in tbe ore in the south cross cut from the bottom of the incline.

Baltimore Consolidaten.—Siuking the shaft is making excellent progress, the rook in the bottom working finely. It is now down 61 feet below the third station.

Yellow Jacket.—Prospecting the 1,400 and 1,500-ft. levels continues as usual.

Ophir.—Both the main west and prospecting drifts south, on 1,700-ft. level, are driven energetically ahead, with some fair indications of future ore developments.

Kossuth.—The main west drift, at the 250-ft. level, is still driven vigorously forward, the rock in the face blasting out finely.

Calenonia.—The new reels are in place, and everything ready to resume the extraction of ore from the lower levels in a very short time.

Empire.—All the drifts on the lower level are showing improvement and making good progress. Some high grade ore has been developed, giving hope of soon finding a valuable and permauent body.

Knickerbocker.—Everything is in readiness for the erection of the new machinery as fast as it arrives. Two large boilers and two heavy hoisting engines will be delivered at the mine this afternoon. The remainder of the machinery will be on the ground in a very few days.

American Flat —The main southwest drift at the third station is still driven ahead with steadily increasing prospects of good ore developments when crosscutting the ledge shall be resumed.

Arizona.

MOHAVE COUNTY.

Items.—Arizona *Miner*, Nov. 1: "We have rumors of a rich strike having been made by a prospecting party ahout twelve miles from here; but know no particulars as yet. As the landing for the greater portion of the Cedar Valley district, considerable ore is shipped from here to San Francisco, and merchandise received for the mines. "Have just returned from Cedar Valley district, which looks very promising. New and rich discoveries are made nearly every day. The old claims improve wonderfully with depth. Some men are arastraing, others shipping ore; hoth with success, and a more cheerful set of miners could not, I think, be found in any part of the world, every man feeling convinced that the camp will 'soon "come out."

Colorado.

New Mines.—Central *Register*, Nov. 12: Reports come from Santa Fé that Baldwin's expedition has discovered large and valuable deposits of cinuibar near the boundary line between Colorado and Arizona.

A Party of six or eight persons will leave Black Hawk in a few days for tbe mines on the San Juan.

The *Mining Review* says that the gold and silver product of Colorado, for the current year, will amount to $5,000,000, abont $2,200,000 of which will be gold, and the remainder, or larger portion, silver.

The roasting furnaces for the reduction works at Middle Boulder will probably arrive at Boulder City to-day. They are fifteen feet in length and six feet in diameter.

The Mountain City lode, situated on U. P. R. hill, and worked by Messrs. Miller & Co., is yielding very satisfactorily. The ore obtained in sinkiug yields from four to eight onnces per cord. It is intended to pnt up a good shaft-honse and work all winter. After sinking a few feet more, drifts will be run, opening up ground for the employment of quite a number of men. This will place the Mountaiu City in the list of prominent ore producers.

The newly opened coal bank near Valmont, on the Colorado Cental, which is owned in part by Teller and Turck, is already producing two carloads of "black diamonds" per diem. The coal is said to he of excellent quality for looomotive purposes.

Idaho.

South Chariot.—*Avalanche*, Nov. 15: Just before going to press we learn from an nndisputable source that they have struck an immensely rich 3 ft. vein in the face of the 6th level drift, 470 ft. north of the Sonth Cheriot main drift. A large piece of the ore shown us, fairly sparkled with pure silver mingled with gold. At a depth nf 10 ft. in the winze which is beiug snuk hetween the 6th and 7th levels, 320 north of the sheft, they heve also strnck the ledge, similar in size and rickness to thet just found in the 6th level. The South Chariot is nndonhtedly, to-dey, one of the very hest mines on War Eagle Mountain. There is no mistake sbout it whetever.

Silver City mine on Florida Monntain was was recently sold at Sheriff's eale, R. H. Leonerd being the successful bidder at $2,000. He bought the mine for the intervenors.

All the mines in Owyhee continue to look splendidly. The mills are all husy, and every stamp is kept ponnding away nigbt and day.

Montana.

GREENWOOD COUNTY.

New Mines.—Moutane *Independent*, Nov. 8: The mines are situated ehout five miles north of Greenwond, and were discovered about two months ago by Mr. Cal. Adems, who has been working in the District since that time. The gold is coarse and of good quality.

One hundred snd five claims have been recorded; 45 helow and 60 above discovery. In the spring there will he from 40 to 50 sluices running in the Camp and not less than 150 men will find profitable employment in the new mines.

Messrs. Wm. Butler & Co., are digging a ditch from the right fork of Dog Creek to Meadow Creek Bar, and will have it completed hy the first of May. Tbe company have ground enough to last ten years, and it will pay from $10 to $20 a dey to the haud.

McIawin & Rowen have a claim opened in Hope Gulch aud intend to work all winter, using spring watet to wash with.

Hornevill & Finn are driftiug on Unole Ben's Gulch, and are taking ont rich ground.

The miners are all highly elated with their prospects, and some fifty men will winter in the Camp.

MADISON COUNTY.

Summit.—Cor. *New North West*, Nov. 15: Work in the Gulch is suspeuded, with the exception of a few claims that will be drifted, until spring opens. The four fluming companies have done well—and in faot no one seems to have much to complain of, as over $40,000 in dust have been taken down to Virginia City from Summit district since the first of Jnne. This, all must agree, is a good showing for a district as small as Summit.

Quartz Mining is rather duller than nsual. Why it should be so, I cannot imagine, for every pound of quartz crushed in Summit the past summer paid well. Mr. T. Conner & Co. are running a tunnel to prospect the Oro Cache, and seem confident they will be repaid for all the labor and money expended in prospecting. Messrs. Shroyer and Roister are working the Kearsage lode, and are taking out a fine quality of ore. The rook worked from this mine last June paid thirty-seven dollars per ton; and there is plenty more of the same sort left to be taken out this winter.

Lower California.

The New Japa Mines.—San Diego *Union*, Nov. 22: Reports from these lately discovered placer mines in Lower California, are very favorable. About 80 men are now working in the diggings in Japa. The country has been but little prospected; and new discoveries, some of them very rich, are made every day. Much excitement prevails concerning these mines at San Diego, parties leaving there daily, for the mines, with complete outfits, and in such numbers, it is said, as to give the city the air of one of the up-country mining towns in tbe days of '49. Sufficient dust has been brought in, to make a good showing aud keep up the excitement.

Utah.

OPHIR DISTRICT.

Cor. Salt Lake *Tribune*, Nov.11: The mines are all pushing work in the face of the approaching winter, and are expecting to do so for four or five weeks, if the weather remains pleasant. The weekly shipment of the several mines have been as follows: The Emma mine shipped about 90 tons; the Grizzly 100 tons; the Daveuport 150 tons; the Vallejo, 60 tons; the Toledo, 25 tons; the Oxford and Geneva, 20 tons; the Prince of Wales ahout 30 tons.

The Oxford and Geneva are continniug their shipments as usual, averaging about 5 tons daily. This amount leaves the mine, bnt considerable trouble is experienced in getting it down the newly made road in time, owing to its icy condition. A new level is beiug driven 75 ft. from the tunnel level, and looks promising so far as it is now driven. The work of sinking the main shaft (now down 185 ft.), 200 ft. deeper, will be pnshed to its termination without delay. The Company hopes to develop another large and rich body of ore when the required depth is attained. The provisions for the winter have all been gotten np and housed, so that at least one more mine can he added to the list of those that will work all winter.

The Flagstaff Mine has again resnmed work with a reduced force of about 40 men, and it is said at the low figure of $2 a day; it is proposed to work the ship-ore during the winter.

The Emma Mine continues to work out the second-class dump, and are pushing up their repairs for the winter, in order to proseoute work on this valuable mine without interruption this winter.

Mineral Resources of Spain.

Few countries, if any, possess the mineral and other resources of Spain. Her mountains teem with silver, quicksilver, lead and copper. Iron ores of the finest qualities exist in abundance. There are coal fields of great magnitude with rich seams of excellent coal. The surface of the soil produces all necessaries, and even luxuries, in abundance. Political troubles have, however, for more than half a century disturbed the Peninsula, and, as a natural consequence, every sort of industry has flagged. The underground wealth has been in a great measure neglected—the fertile fields indifferently tilled. Under the circumstances it is gratifying to find that, notwithstanding the difficulties which stood in the way, a marked progress has been discernible in the development of the mineral production, not only of raw ores but of manufactured metals, during the five years which elapsed from 1865 to 1870. Since then causes which it is needless to recapitulate have exerted a baneful influence and made it difficult to collect reliable data on the subject; but there can be but little doubt that the impulsion already given still exists, and will again become manifest so soon as the present unfortunate state of affairs shall have passed over. In 1870 the value of the minerals produced in Spain was between six and seven millions sterling, representing something over one-half of raw ores and the remainder of manufactured metal. In these industries there were at the time 40,500 individuals employed, of whom 33,000 were men, 1,500 women, and 6,000 children. There were besides 266 blast furnaces with 10,000 workmen.

The increase in the production of the year 1870 over that immediately preceding had been very great, being about 169,050 tons, which showed a very considerable activity. It was particularly remarkable in the case of iron, in which the greatest increase had taken place, it being 62,650 tons. In 1866 the total production of iron was only 90,000 tons, and in 1870 it was 216,000 tons. Whilst this development was going on in the production of iron during the period from 1866 to 1870, an increase of greater value, though not of so great relative proportion, was occurring in other more valuable metals—quicksilver rising from 5,750 tons to 12,000; copper from 140,000 tons to 200,000 tons, lead from 130,000 tons to 154,000 tons, and spelter from 35,000 tons to 60,000 tons. In all these calculations no account has been taken of salt, raw or manufactured. The salt works of the State, however, produced salt of the value of over four millions sterling, but the number of workmen employed in the manufacture is not stated, though it must be very considerable. The principal export from Spain is lead, as it is one of her chief products. Thus Spain turned out from 1865 to 1870, of lead ore 16,600,000 quintals, of pure lead 3,809,890. England has produced only 4,800,000 quintals of ore, but its lead is pure galena, yielding from 73 to 74 per cent.; while Spanish ore yields but 15 per cent. of lead. Silver also, which is found in conjunction with the lead and zinc ores, is also largely found in Spain, and with the increase in the production of the former metals it has also gone on advancing, and from a production of 23 tons of silver in 1866, it had attained 29 tons in 1870; the total yield for the five years up to 1870 being 132 tons, an excess of 51 tons over the preceding period. The total amounts in tons 1,000 kilos. each, of minerals and metals which Spain exported in 1871 were—Steel, in bars, 18; quicksilver, 1,390; copper ore, 3,300; ditto, bars, 900; manufactured, 78; wrought iron, 88; old rails, 4,000; pig lead, 38,000; ditto, silver-bearing, 39,500; wrought ditto, 27; spelter, in slabs, 1,257; galena, 1,000; pyrites of iron, 140; antimony, 57; copper, 164,000; tin, 2; iron, 253,300; manganese, 24,000; spelter ore, 3,400; calamine, 48,000; phosphate of chalk, 40,000; and jet, 23. The Badojoz-Lisbon Railway took, in 1870, 27,000 tons of Spanish phosphate of chalk, which was shipped to England.

The above statistics show that even already the mineral and metal production in Spain had acquired in 1870 very considerable dimensions, and was in the fair way of becoming a source of large revenue to the country. For the present a marked decline is noticeable, but so soon as affairs shall have settled down, it is not to be doubted that it will again not only resume its previous activity, but go on steadily advancing. The natural wealth of the country is so great that the national energy may for a time be depressed, but it cannot be destroyed, and requires only the fostering help of a strong Government which can afford security to property, to enter on a new era of progress and prosperity. This will be the more apparent when the large amounts produced by the mining industry of the Peninsula are taken into consideration. From the official statements it appears that the ores raised in the five years under consideration amounted in value to over 11,000,000 *l* sterling, whilst the pure metals sold were worth about 13,000,000*l*. sterling, exclusive of salt. The relative amounts of ores and pure metals exported at different epochs, five years apart, were in metric tons—Ores of all kinds, 1861, 4,900; 1865, 106,000; 1870, 500,000; Pure metals, 1861, 15,000; 1865, 41,000; 1870, 84,000. From these figures it is clear that great progress had been made, and that had other circumstances been favorable, the trade would by this time have assumed very large dimensions and it is satisfactory to notice that whilst the export of ores went on increasing, that of pure metals was going on augmenting at the same time. The production, indeed, was beginning to assume very considerable proportions, and gave promise of a still further development. The mines and salines belonging to the Government were in regular working, and had yielded—Almaden quicksilver mines, 26,000,000 francs; Rio Tinto copper mines, 8,000,000 francs; Linares lead mines, 3,000,000 francs; State salines or salt works, 105,000,000 francs. It will, of course, be some time before Spanish industries will resume their wonted state, should even all political disturbances disappear from the horizon; but that they will do so sooner or later, is self-evident. Wealth so great as that which belongs to the country cannot be left long unattended to. Should the means for developing it not exist on the spot, money will easily be forthcoming from the capitalists of other lands for so promising an investment. When this is the case, Spain will commence again to resume the place she once held amongst nations, and besides being herself a large producer, will also become a large purchaser. Nothing is more likely to conduce to this end than the development of industries in the country adapted to its climate and its position, and the construction of ready means of transport and locomotion in extended railroad systems, which will not only furnish markets for the produce, but bring the different sections of the people into closer contact, and make them see that the general is the individual interest.—*London Mining Journal.*

Gravel Mines of Tuolumne.

A correspondent of the Tuolumne *Independent* says: I have just returned from a visit to the Alpha and the Blue Gravel Table Mountain mines, located in Table Mountain, west and north-west of the town.

The Alpha

Is an old mine, never having been much worked, however. It was formerly owned by Harvey Mays but subsequently re-located by a Jamestown company, in connection with Mr. Marks and others, of San Francisco. Mr. Marks was made Superintendent, ran an incline and got out some good pay gravel. Jamestown partners in the mine, not being exactly satisfied with the manner in which things were shaping themselves, sold out to John Roberts and other owners in the Blue Gravel Mining Co. The Superintendency then slid from Mr. Marks to Col. M. G. Gillett, the accomplished mining sharp of years' practical experience in old Table Mountain. Under his supervision, the Alpha has commenced to assume a shape which looks like business. He has opened out the original tunnel, which at once taps virgin gravel and drains the mine. He is now waiting only for water to commence washing up and securing the root of all evil. From the Alpha I visited the

Blue Gravel Table Mountain Mine,

Which is adjoining and immediately north of the Alpha, and owned in part by members of the same company. Just as I arrived, that 200 pounds of originality, Col. M. G. Gillett, drove up. Wanted to know "where I was going;" told him "right here; come to see you, Gillett. I want to go through you; that is to say, I wish to interview you. I am here in the capacity of reporter for the *Independent*, and I wish to find out all you know, and more too, if possible, about this mine; to the end that its past renown and future greatness may be mirrored forth in the columns of the aforesaid journal." Mr. Gillett kindly showed me around, and gave me much information, relative to the mine, his future plans of operation, etc., which I will endeavor to set forth here. Already fearful of trespassing upon your space, I will endeavor to be brief.

Some 18 years ago, work was first commenced on the "Humbug," the original name of the present "Table Mountain Blue Gravel Mine," —a misnomer. A tunnel was then run in near the center of the mine, and the work prosecuted in a northerly direction—and during that long period of time it has been constantly worked and constantly declaring dividends. Where the original tunnel was run in, I have been informed by Mr. Wheelock, some of the very richest gravel ever taken out of this famous mine was found. Mr. Gillett has recently caused an incline to be run down, tapping the channel where first tapped 18 years ago, and has been rewarded by finding there a channel of 100 to 125 feet in width, and of the very richest character. He immediately commenced to erect a new mill and wheel in which he will place a new Cox Pan at the mouth of this new incline. He will also have a first class engine there to be used for hoisting purposes.

The old works are by no means worked out yet. The Superintendent informs me that there is a year's work for a full force of men, now in sight, with a channel 150 feet in width. A new incline has been run down, striking this channel, and the Col. is now engaged in moving the old mill up to the mouth of this new incline, thereby making it handy and easy of access in conveying the gravel to the mill.

The entire amount of expenditures incurred in these improvements will aggregate the sum of $5,000, which Gillett says breaks his heart; but adds, "we have enough of the blue gravel funds already on hand to meet the liabilities, with coin to spare."

W. C. Wheelock, of our town, an original owner in the mine, or, as Gillett calls him, "Lieutenant-General Wheelock," is General-in-Chief of the new works; and as he is aided by a competent force of first-class mechanics from your city, the mill will soon be in good running order.

The result of these improvements and the new developments going on, will soon place in active operation here three mines with a bright a future as that of old "Humbug" mine, employing a force of perhaps 75 men, and all under the supervision of an intelligence, who, by recent results, proves that he knows what he is doing.

These things look encouraging for the future; they give a cheering impetus to our business men here. The outlook is certainly more favorable in the mind of your correspondent than it has been for years.

Treasure Hill.

Since the discovery of silver on this famous hill, such dull times have never been known as at present exists there. A visit to the old stamping-ground of thousands now scattered world wide, reveals a marked change from former days, and where throngs of people filled the narrow street, one could now fire a 100-pounder, loaded with cannister, its entire length and not hurt a man. Still there are some sixty men engaged in the mines of the Eberherdt & Aurora company, the only mine now being worked to any extent. A casual observer would suppose all this inactivity and apparent desolation was the result of failure in the mines; but a close examination would at once convince any one that such was not the case. The fact is, as we have persistently stated, knowing from actual observation our statements are correct, that never in the history of Treasure Hill, not excepting the days of the great excitement, have the mining interests ever looked so well as now. Particularly is this the case in the Edgar mine, of the Ward Beecher Consolidated. We are informed by practical miners, who have worked constantly in the above mentioned mine, and have had their assertions verified by mill men, that there now remains enough ore in sight to guarantee the working of forty stamps for a year. This is not written from hearsay; it is the actual state of facts, which can be abundantly proven by inspection. For the purpose of enriching a few, the many stockholders, the miners, and the interests of the entire county are being sacrificed. While our institutions deny no men or set of men the right to work their properties in their own way, we still hold, notwithstanding, that the people have some rights, which ought to be respected, and that justice should dictate the equal distribution of profit arising from labor. In this company, as also the Hidden Treasure, we have a sample of monopoly, the great curse of our country, one which, to the people directly interested, equals any other now agitating the political world. The question, pertinent to the case in point, could and should be asked by the stockholders, as to what disposition has been made of the money accruing from the last run of the Manhattan mill, when the average results of three or four months' operations were from $30 to $50 per ton of ore. Why, in the face of these results, should assessments be levied, and the stock of a company doing nothing be $7 per share, and that of the mine producing such returns not be quoted at all? We know of men owning stock in the Ward Beecher, aware of the intrinsic value of the Edgar mine, who are poor comparatively, and who have to come out with one dollar a share very frequently, and can sit in their own doorways watching the teams laden with their ore on the way to the mill. Of course we all understand these operations; of course we know why this manner of conducting mines is adopted; but let us assure the gentlemen operators that, after a time, forbearance ceases to be a virtue, and a day of retribution will surely come, unless they change the present selfish mode of working mines. The system of "freezing out," now so common, must cease, and the working-men stand an equal chance with the monopolizing capitalist.—*White Pine News.*

Cement Gravel.—The Stockton *Independent* has the following: Mr. A. Sciefford, of San Andreas, brought to this office some specimens of cement gravel taken from a newly opened mine in Calaveras county, about four miles from San Andreas, which excelled in richness anything we have ever before seen. The gravel is perfectly lousy with gold, besides what is seldom seen in such materiel—large quantities of fine particles of sulphurets of iron. The mine from which this was taken is on the noted blue lead of Calaveras, which paid so extravagantly in the neighborhood of Mokelumne Hill, and later in the mine owned by R. H. Paul. This mine has not been previously worked on account of the prevalence of water, but parties commenced a tunnel to drain it several years ago. Owing to the lack of capital the work was suspended after the tunnel had been run nearly eleven hundred feet, and it is only within the last few months that operations have been resumed and the channel at last struck. From the description given by our informant, the present owners have a very promising prospect. Joseph Dias, a well-known citizen of Stockton, is one of the fortunate individuals.

New Mode of Treating Gold Quartz.—Some experiments have been tried publicly during the month of a new process of treating quartz, discovered and patented by Mr. E. Reading of Castlereagh street, Sydney. As far as the experiments have gone they have been highly successful. The treatment consists first in burning the quartz, and then whilst red hot plunging it into a bath prepared with acids. The effect of this is to utterly destroy the silica in the quartz, and to render it perfectly friable, so much so that it can be readily reduced to powder by the Chilian mill, without the intervention of the ordinary crushing battery. Besides this, the silica being destroyed, what had previously been stone is converted into an earthy matter, which is carried off easily by a gentle flow of water through the basin of the mill. The sulphurets, too, are all destroyed, and the quicksilver continues bright and lively, taking up every particle of the gold, however fine.—*Thompson's Investment Circular and Share List.*

Dutch Flat Mines.

A correspondent of the Truckee *Republican* writes from Dutch Flat as follows:

"Staple Bros. are running a tunnel from the Cañon lead into Bear river, up to their old Somerset claim. They have been at work on it since July, and will soon be in 200 feet and ready to raise the shaft. The Cedar Creek gold mines and water company have been employing a great number of men during the past summer and this fall, in cleaning and repairing its different ditches, flumes and reservoire, and fitting up its various claims preparatory to washing the coming season. This company started a bed-rock tunnel last July, to run from the month of Dutch Flat cañon to the Deep Shaft claim, a distance of about 3,000 feet, for the purpose of washing to the bed-rock all of the rich deposit overlying the ancient channel, under which it will pass. This tunnel is being run by hand at present, but a Burleigh drilling machine is now on the way, which, when it arrives and is set up, will press the work onward at a rapid rate. The motive power for the drill is compressed air, led through an iron pipe into the tunnel. The machinery will be driven by water power, of which the company have plenty for this purpose the year round, the pressure at this point being 750 feet. Aside from the rock in the face of the tunnel, four shafts are to be sunk—one of which is already down about 140 feet, and the tunnel run from them—it being the intention to run from eight faces, so as to complete the tunnel as soon as possible. The face of the main tunnel is now in about 200 feet, and it is expected will be completed in eighteen months. This is quite an important enterprise for our town, as all of the surface gravel had been washed off, and it became necessary for some such an enterprise to resuscitate and keep alive the little trade we have. The company have had not less than fifty men in their employ during the entire summer (who heretofore have remained idle from the ending of one washing season to the commencement of another) and the coming water season will employ about 150 men in all, besides a number who derive a living by cutting blocks, pitch wood, etc. It is the opinion of experienced miners that the best days of many of our mines are yet to come. The London company have brought the greatest number of mines in this vicinity, and having an immense amount of capital will work them thoroughly.

International Mill.—Capt. Frank Drake assures us that, if no mishap occure, his splendid 30-stamp mill will be in running order on the 17th inst. We are sincerely pleased to know this fact, and trust his anticipations may be more than realized in its working. While passing through the mill the other day, it was a matter of astonishment to notice the immense amount of work accomplished in so short a time. Reverting back in memory to the apparently useless mass of *debris*, which remained after the great fire, wherein were mixed broken castings, charred timbers, bent shafting and all the accumulation of wreck and ruin, one cannot but admire the skill, ingenuity and perseverance which have been displayed and made manifest in the magnificent structure now almost completed. Only such material as would necessarily be destroyed by fire has been purchased to replace the old, a fact a casual observer would never notice while looking at the mill. Everything has been done to render the institution one of convenience and comfort to the workmen, and all experienced mill men assert that there is no better appointed or before made extended mention of the new constructed mill of the kind in Nevada. We have structure, but cannot refrain at this time from offering our sincere congratulations to all concerned for the successful completion of the work.—*White Pine News.*

The Rattlesnake Mine.—The Sonoma *Democrat* of November 1st gives the following as the latest from the unique quicksilver mine: Two cute have been made into the mountain, one about twenty-six feet deep. From both ends tunnels have been run. Near the surface they struck a mass of cinnabar and vein matter, holding free quicksilver; both vein matter and ore of astonishing richness. The free metal follows the flow of the pick and trickles down the sides in globules. It runs together and stands in little pools on the floor of the tunnel. We saw dipped from a hole in the floor, with a shovel, a mass of blue clay, some water, and a greater proportion of quicksilver than either. We saw an oblong piece of cinnabar, not so large as a bag of shot, which weighed thirty pounds; it was valued at twenty-five dollars; there was in it only sufficient foreign matter to hold the mass together. A number of specimens of this kind were placed in a sack, it was lifted up and beneath there was a pool of metal.

Useful Information.

Paper Decoration.

Under this head the *London Furniture Gazette* makes some sensible remarks. Speaking of the decoration of dwelling rooms, it says paper hanging is, of course, not of ancient date, for it is but about two hundred years ago that the practice of hanging paper on walls, and decorating it by etencil distemperiug aud by drawing, came into use. The next improvement was to print an outline by means similar to that now employed in block-printiug, and upon that basis filling in the colors iu stencil and by hand. The art gradually developed to what it was about forty years ago, since which time it has made little progress, except in the adaptation of machinery, toward the supply of the vastly augmented demand.

We offer some suggestions in the hope of promoting improvement, and because the subject is interesting. Sick people know the torment of some patterns, and although they would he difficult to please in any case it often happens that their criticisms and objections are endorsed hy tunse in good health. Comfort and propriety form the ultimate court of appeal iu all matters of furniture and decoration. What sense is there in putting into a poor man's hedroom a small hard diamond pattern? If he is well he can hardly see it because it is so dazzling, aud if he is ill he will put his head under the sheet as often as he can; and yet this is one of the choicest specimens for a bedroom. The sick man sighs in vain for the hanished chintz hangings of the unhealthy kind, because that some birds of paradise, some convolvulne or rose, some sprig, leaf or tendril, unending, would he changeful objects for his weary time.

Then there is a freak of fasbion in color which is not easily accounted for in England, where the climate and sky would suggest brightness as the first elemeut of proper taste. We refer to the continual use of light brown for dining-rooms, with generally the adjunct of aome gold pattern. This looks so elegant and snitable when on the stand at the paper-hanger's shop that its selection is not to be wondered at, especially as it looke like tooled leather, which was in vogue hnndreds of years ago; but experience must have taught many persons that such colors absolutely absorh the light, aud that its delicaoy flies very speedily indeed. Yet that taste prevails. And surely the decorator who knows all this shonld endeavor to find some new idea that shall be an improvement, some grounds that do not absorh the light but increase its influence, that do not so rapidly "perish in the using" and some patterns having more in them than the plain imitation tooling of the bookbinder, and yet free from the flaunting vulgarity of thirty years ago.

Suggestione have heen made, having for their object the rendering of papered walls instructive to the honsehold. It arose from the circumstance that in the early days of paper decoration, when part of the labor was handwork, it was not nncommon to fill up certain spsces with water-colored drawings, or chalks, executed hy the ladies of the house or their artistic friends. Some antiquarian scholars sought to bring the psper stainer's art to their service by suggesting that small spaces in cheap hangings should he devoted to separate pictures of plauts, hirds, animals, etc., hut the idea was impracticable.

But the pictorial idea is much too good to be abandoned; and for houses of the hetter class, there should be an attempt to set on foot an enterprise of change. These could well afford a new design for a ground pattern, composed of the floral and the scroll, light, graceful, aud of the most correct taste. In this pattern-ground there might be introduced spaces of varioue well-known sizes, into which the vast variety of French and Austrian oleographs, or best wood engravings, conld find a place at once bright, effective, and beantiful.

To Clean Paint.—A correspondent of the *Country Gentleman* says: Use hut little water at once; keep it warm and clean by changing it often. A flannel cloth takes off fly specks better than cotton. Soap will remove the paint; so use but little of it. Cold tea is the best liquid for cleaning varnished paint, window panes and mirrors. A sharp piece of soft wood is indispensable for cleaniog ont corners. A saucer of sifted ashes should always be at haud to clean unvarnished paint that has hecome badly smoked; it is better than soap. Never put soap upon glass, unless it can be thoroughly rinsed off, which can never he done to window glass. Wash off the specks with warm tea, and rub the panes dry; then make a paste of whiting and water, and put a little in the center of each pane. Take a dry cloth and rub it all over the glass, and then rub it off with a chamois skin or flannel, and your windows will shine like crystal.

Hardening Lead.—Lead which coutains sulphur is so much harder than pure lead that galena or native snlphide of lead is often fused with the lead to give it hardness. A small quantity of antimony has the same effect. By combining the two processes and smelting together five parts hy weight of lead to one part sulphnret of antimouy, a hright hard regulus is obtained, which may be added to ordinary soft lead in snitable quantities to produce the desired hardness.

By fusing two parts of galena and one part sulphide of sntimouy, sulphurous acid is given off, and a regulus of hard lead is obtained similar to the above, and consisting of sulphide of lead and antimonuretted lead.

Good Health.

Fish, Chemically Considered.

By chemical analysis, says Prof. Wetherbee, it is found that fish contains a greater proportion of phosphorus than any other class of animal food, aud therefore must be considered the richest "hrain food." In land animals the phosphorus is coutained for most part in the hones, in combination with lime, as a phosphate, while the muscle is rich in fibrin, etc. Bnt on the nther hand, the various genera of fish, although not abounding in fihrin, are much richer in phosphorus, and this element, as a general rule, varies according as the fish ia lively or slow iu its movements and habits. Upon this difference depends, in a great measure the relative value of different kiuds, those containing the greateet proportion of phosphorus, and consequently those of the most rapid movement command the greatest prices. Thus, the salmon a fish of remarkable agility in its movements, and its nearest relative, the trout, are among the most expensive of the varieties in our market, while the less active kinds command but inferior prices. But an exception to this rnle, due only to ignorance or prejudice, is exemplified in the New England farmers of the last century, who were often bound by legal obligations not to feed their apprentices more than three meals a week upon salmou, as it was exceedingly plenty, and therefore, fit only for those who were too poor to obtain anythiug else. The same worthy farmers were wont to consider oysters a mere luxury for the epicure, and they were generally associated with champagne, late snppers, aud high living generally. But in our seaport towns they are undouhtedly among the cheapest, and by no meaus the least nutritious articles of diet, although we have recently seen it asserted that they contaiu no nutriment. We have also seen philosophers who contended that cheese was only a luxury and contained none of the elements of nutritiou, being ignorant of the chemical fact that the casein of the cheese and the fihrin of meats are almost the same, and are hoth resolved by constructive assimilatiou into muscle.

Thoee natious who eat fish with one meal each day are nndouhtedly the most active in intellect, and the most capahle of hrain labor without exhaustion or fatigue. Even those savage tribes who subsist in a great measure upon fish no doubt possess very quick minds although they are uncultivated and iguorant, and other causes may tend to keep them in a deplorable and degraded condition. But when once civilized and Christiauized these tribes of *Ichthyophagi* hecome quick and active in intellect, eveu to put to shame the more stolid beef eaters of our inland towns of Christiau lands. Not only is such phosphatic food conductive to the activity of the brain, but it promotes fecuudity and increases the ahility to endure cold, fatigue, etc., and, while facilities for obtaining it are coustantly increasing, it would he well for the rising geueration were they made to partake of and to realize it as second only in many respects to the staff of life, and the husband and father who occasionally takes half a day from his legitimate business to fill his basket with delicious fish should not he considered as a mere "sportsman," hut a "good provider" for his family of those things of vital utility.

Natural Appetite. — As a general thing, people should consult their natural desires more in the selection of their food. Snch desires are calls to satisfy the wants of the system, and therefore are not given us in vain. If in warm weather the relish for meats and heavy food is less, or even disappears, it should not be eaten; hut if, on the other haud, there is a craving for fresh vegetables and fruit, it shonuld by all means he indulged iu; it acts like a correctiug, purifying medicine on the digestive apparatus, sometimes deranged hy the heat of summer. Let nobody be afraid to live during hot weather on vegetable diet exclusively. On the contrary, when abstaining from meat one will suffer less from protracted heat, especially when abstaining also from distilled or fermented liquors, and drinking water and milk instead. In winter, on the coutrary, we may have a craving for animal food and fat, and then it is time to indulge in it. However, the flesh diet should always be balanced with vegetables and hread or its equivaleut. No animal requires perhaps such a variety of food as man, who is neither carnivorous, like the lion, nor herbivorous, as the horse, hut omnivorous, like the pig, whose digestive apparatus resembles that of man more thau is the case with most other animals. If this is considered rather flattering for the pigs or insulting to men, it cannot he helped.—*Manufacturer and Builder.*

The Abuse of Chloral.

We regret to say that from various quarters we have received trustworthy reports which leave no douht that this very valusble medicine is heing grossly abused hy the public. Hydrate of chloral has received no more than its just praise from those medical writers who have described it as the hest aud safest soporific mediciue in existeuce. But no medical authority has ever dreamed of sanctiouing its employment except nnder direct medical order; yet the public are, to a large exteut, taking it on their own responsihility. In this husy and distracting age the demand for sound and undistnrhed sleep in one of the most urgeut calls of jaded natnre, and it is not nnnatural that people should catch at anything which seems to promise to give repose with certainty and safety. This makes it all the more necessary that the public should be plainly told that chloral is no more to he admiuistered safely hy unskilled hands than is opium or strychnia. There are several ways in which its improper use may cause serious mischief. In the first place, a single overdose may cause death by failure of the circulation, and there seem to be very great differences between persons as to the dose which can be taken without any danger of this fatal catastrophe. The other possible evil results of chloral are chronic. Where it is taken without proper reasons repeatedly for a considerahle time, it may produce either, or hoth of the following effects: it may seriously affect the intelligence and memory, or it may produce partial paralysis of the limhs. The latter is a fact which we have not yet seen recorded anywhere, hut it is becoming known to observant practitioners, and will henceforward have to be reckoned as a possible consequence of the rash use of chloral.

Besides all these things, chloral is fully as guilty as opium or any other recognized narcotic of the tendency to render those who take it the slaves of habit; and we are not sure that the moral enfeehlement which it thus induces is not even greater than that of opiun-eating, unless the latter be carried to great excess. In a word, chloral is a most valuable medicine in the hands of a judicious doctor, hut it is also a most dangerous plaything or luxury in the hands of people who merely wish to escape from the sleeplessness of anxiety or of fashionable *ennui*.—*The Lancet.*

Stammering.

According to M. Chervin, a French gentleman and author of a very successful system of treatment for this embarassing and aunoying misfortune, stammering consists solely in defective co-ordination of the movements of the organs of speech. To correct the difficulty he begins with the respiratory organs, and the pupil is csused to inspire and expire regularly, pausing between respirations. Theu the vocal orgsns are next called into action, hy the emission of the vowel sounds—care heing taken to avoid a useless expenditure of air, uutil the vocal cords have become habituated to contract regularly, as desired by the pupil—then the lips and tougue are called into play by the articulation of the consonant sounds. The author has adopted an ingenious system, similar to musicsl notation, by which he represents to the eye of the nnpil the quantity to he given to each letter, iu pronunciation, aud, in his more adv nced exercises, the places where the voice should pause for inhalation. His *resume* of general directions to stammerers is worthy of careful note by all thns afflicted, and who are willing to take the trouhle necessary to relieve themselves:]"Take a full inspiration before commencing, speak slowly, articulate distinctly, slightly scauning each syllahle, sustain the voice with an accompsnying gesture, a methodical and somewhat declamatory intonation." The practice of this he considers an infallible remedy. Of course all this cannot he done in public and in daily conversation. The stammerer must be willing to go by himself regularly and exercise his organs.

Trichinæ in Pork.—The time had gone by, we had supposed, when there was auy danger from eatiug pork that might be infested with this frightful ahomination. We had thought further more that it was not an affection much diffused in the United States, hut a paragraph from the London *Medical Times*, printed helow, seems to indicate that it is more common here than in Germany, where the worm was first detected and where large numbers of people were made ill, and some died from eating badly cooked swine-food, the home of infinite numbers of those minute parasites of the flesh. "As there is a large importation of American bacon into this country, a statement made in *Virchow's Archiv* (April 10) is of great importance. It is there said that among 6,555 swine slaughtered and examined in Rostock during 1872, none exhihited trichinæ. But of 622 flitches of bacon imported from America which were examined, 12 were found to be infected with trichiuæ. Besides these, a much larger portion of the imported bacon was disposed of without having heen examined."

Care of the Hair.—To keep the hair healthy, keep the head clean. Brush the scalp well with a stiff brush, while dry, then wasb with Castile soap, and ruh into the roots bay rum, hraudy or camphor water. This done twice a month will prove heneficial. Brush the scalp thoronghly twice a week. Dampen hair with soft water at the toilet, and do not use oil.

Domestic Economy.

Cooking Poultry.

Poultry should never he eaten in less than six or eight hours after it is killed; but it should be picked and drawn as soon as possible. There is no direr disgrace to onr Northern markets than the practice of seuding whole dead fowls to market. A writer says: I have bonght such from responsihle poultry-dealers, and found them uneatable, from having remained undrawn until the flavor of the craw and intestines had impregnated the whole body. Those who are conversaut with the habit of careful country housewives, of keepiug up a fowl without food for a day and night before killing and dressing for their own eating, cannot but regard with disgust the surcharged crops and puffy sides of those sold *by weight* in the shambles. If you want to know what you really pay for poultry, honght in these circumstances, weigh the offal extracted from the fowl by your cook, and deduct from the market weight. "Bnt don't you know it actually poisous a fowl to lie so long undressed?" once exclaimed a Southern lady to me. "In *our* markets they are offered for sale ready picked and drawn, with the giblets—also cleaned—tucked nnder their wings."

I know nothing about the poisonous nature of the entrails and crops. I do assert that the custom is unclean and unjust. And this I do without the remotest hope of arousing my fellow housekeepers to remonstrance against established usage. Only it relieves my mind somewhat to grumble at what I cannot help. The best remedy I can propose for the grievance is to buy live fowls, and, before sending them home, ask your butcher to decapitate them; the probabilities heing greatly in favor of the supposition that your cook is too "tinder-hesrted" to attempt the job.

One word as to the manner of roasting meats and fowls. In this day of ranges and cooking-stoves, I think I am speaking within hounds when I assume that not one housekeeper in fifty uses a spit, or even a tin kitchen for such purposes. It is in vain that the writers of recipe-books inform us with refreshing *naivete* that all our meats are baked, not roasted, and expatiate npon the superior flavor of those prepared npon the English spits and in old fashioned kitchens, where enormous wood-fires blaze from morning until night. I shall not soon forget my perplexity when, an inexperienced honsekeeper and a firm believer in all "that was writ" by older and wiser people, I stoed before my neat Mott's "Defiance," a fine snrloin of beef ready to be cooked on the table hehind me, and read from my Instruction-book that my "fire should extend at least eight inches beyond the roaster on either side!" I am not denying the virtues of spits and tin kitchens—only regretting that they are not within the reach of every one. In view of this fact, let me remark, for the benefit of the unfortunate many, that in the opinion of excelleut judges, the practice of roasting meat iu close ovens has advantages. Of these I need mention hut two, to wit, the preservation of the flavor of the article roasted, and the prevention of its escape to the upper regions of the dwelling.

To Cleanse Phials ann Pie Plates.—Cleanse bottles that have medicines in them, by putting ashes in each, immersing them in cold water, and then heating the water gradually till it boils. After boiling an honr, let them remain in the water till it is cold. Wash them in soap suds, aud rinse them till clear in fair wster. Pie plates that have heen long used for baking are apt to impart an unpleasant taste on acconnt of the rancidity of the butter and lard imbihed. Put them in a hrass kettle, with ashes and cold water, and hoil them an hour.

To Pickle Onions.—Choose small, sound silver onions, as eqnal in size as possihle. Top and tail them, but do not pare the tops close, as the air will soften and spoil the onions. Scsld them with brine. Repeat this on the second day, and, when cold, peel the onions as quickly as possihle, throwing them into vinegar ae they are done, to preveut their hlackening. Boil vinegar enough to cover them, with sliced ginger, black aud white pepper and mace: when cooled, pour it over the onions. Cork them well, and dip the corks in bottle rosin.

Colored and white flannels should be washed separately, and never in the same water which has heen used for cotton and linen goods, for not only will the lint adhere to the flannels, hut they are apt to receive a dull, grayish color. Flannels shonld always be washed and dried quickly, and it is a good plan to have them washed first in the morning, hefore the other clothes, especially in the winter, as they dry so much more quickly than later in the day, aud then there is no fear that careless washerwomen will plunge them into dirty suds.

Hop Yeast—One and one-half pounds of grated raw potato, one quart of boiling water, in which a handful of hops have heen hoiled, one teacup of white sugar (coffee sugar) one-half tea cup of salt; when almost cold put a little good yeast to start it, say about half a pint. One pint of this yeast makes four good sized loaves of the most delightful bread.

Veal Croquettes.—Take very fine minced veal, moisten it with cream, and a heaten egg. Season with pepper, salt, sweet marjoram, aud a little pounded mace. Form into small cones, either by hand or in a wine-glass; crumh the ontside, aud fry, or else set into the oven and hake, basting freqnently.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Concentration of Ores; Retribution; Perfection in the Art of Dentistry, 337. Foundry Work; Thanksgiving Day; The Incoming Legislature; Ore Crushing and Sampling Works, 344. Sonoma of California; Huntington's Patent Device for Opening Headblocks; Notices of Recent Patents, 345.

ILLUSTRATIONS.—Concentrating Jigger, 337. Plaza and Barracks of Sonoma; Huntington's Improved Headblock for Sawmills, 345.

CORRESPONDENCE.—The Pioneers of El Dorado County; Mining in Mexico, 338.

MECHANICAL PROGRESS.—Combination in Machines; Incrustation of Boilers Etc.; Steam as an Auxiliary; Invention; Glass Cloth; New Idea in Rollers, 339.

SCIENTIFIC PROGRESS.—Fruit Without Flowers; Origin of Nerve Force; Separation of Oxygen; Incombustible Paper and Fire-proof Ink; New Method of Preparing Caustic Soda, 339.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 340.

MINING SUMMARY from various counties in California, Nevada, Idaho, Colorado, Montana, Lower California, Utah and Arizona, 341.

USEFUL INFORMATION.—Paper Decoration; To Clean Paint; Hardening Lead, 343.

GOOD HEALTH.—Fish, Chemically Considered; Natural Appetite; The Abuse of Chloral; Stammering; Trichina in Pork; Care of the Hair, 343.

DOMESTIC ECONOMY.—Cooking Poultry; To Cleanse Phials and Pie Plates; To Pickle Onions; Hop Yeast; Veal Croquettes, 343.

MISCELLANEOUS.—New Crushing Mill; Nevada Soda; Mint Statistics; Fly-Takers of Cape Colony, 338. Mineral Resources of Spain; Gravel Mines of Tuolumne; Treasure Hill; Cement Gravel; New Mode of Treating Gold Quartz; Dutch Flat Mines; International Mill; The Rattlesnake Mine, 342. The Stickeen Mines; Advantages of Hydraulic Mining; Sharp Practice; Chilian Method of Amalgamation; A Valuable Mining Discovery, 346. The Lower California Placer Mines; The St. Gothard Tunnel, 347.

Our Crushing and Sampling Works.

The old sampling works, Nos. 413 and 415 Mission street, have this week passed into new hands, Mr. J. W. Thurman having sold out to the California Ore Crushing and Sampling company. These works have been running for some fourteen years; they were started by S. W. Howland. Mr. J. W. Thurman afterwards became a partner, and four years ago Mr. Howland went ont, and Mr. Thurmen run the works in his own name. Mr. Thurman was burnt out in 1871, bnt began work again when the building was up, and now Messrs. Judge Craig, Dr. A. C. Putnam, James W. Whitlatch and Major John L. Murphy have started business at the old stand, under the firm name above mentioned.

Mr. Whitlatch, the superintendent and general manager, is well known to the mining community of this coast, but more particularly in Montana, where he has resided most of the time since 1864. He was the discoverer of the famous Whitlatch Union mine, now run by the National Mining and Exploring company and others. Mr. Whitlatch worked on this well known ledge until some $3,000,000 were taken out. He has built some nine different quartz mills on this coast, and one furnace—that at the Starr King mine in Starr King, Nevada. He has had varied experience with mines and ores, all of which will stand him in good stead in his new business.

They have at their sampling works a Brodie crusher, a Howland crusher and two burr mills for pulverizing ore, and intend putting in the requisite machinery to make these sampling works the leading ones on the coast. They will have in a few weeks one of Peer and Lundquist's new concentrating machines (recently illustrated in this journal), and will make a speciality of concentrating ores for shipment. They intend, also, putting up a 5 stamp battery in the rear of their premises, with copper plates, etc., so that lots of ore can be worked by actual mill process. By this means miners can bring down a few hundred pounds or a ton of rock, and see it worked themselves. By comparing the samples and assays with the actual working, and having the sulphurets, etc., concentrated, they can get a pretty accurate idea of what is in the rock, and how much is lost in working. The battery is also for the purpose of giving exhaustive tests of different concentrating machinery, which is already in the market, or yet to be invented. Mr. Whitlatch believes that concentration of ore is a necessity in this country, and wishes to make the best experiments possible, to determine the more worthy machine with particular classes of ore.

Most of the ore brought to these works for sampling comes from Nevada, but some comes also from this State, Arizona, Montana, Idaho, and considerable from Mexico. This is crushed and sampled systematically and then sold and sent to the different reduction works either here or in Europe. They crush considerable fire-clay, etc., for making crucibles. They also crush and sample all kinds of ores in a thorough manner and intend adding all necessary machinery to facilitate operations and increase their business.

Foundry Work.

The Empire Foundry,

The Empire Foundry, Savage & Co., have removed from their old quarters to the more commodious building recently occupied by the Vulcan Iron Works. The Vulcan works still retain part of the building and F. A. Huntington has also moved his machine works from First street to the southern part of the edifice. Mr. Huntington's facilities for doing work are now increased three fold. The Empire Foundry occupies the larger part of the space and have extended their line of work considerably. They now give employment to from 65 to 70 men, making mainly stoves, grates, fenders, blowers, school chairs and desks, fence castings, burial caskets, house fronts, hydrants, sash weights and other castings.

They are now, however, engaged in some heavy castings for the new City Hall. They are making twelve columns, each weighing about 9,000 pounds, and 24 girders weighing a little over a ton each. The columns are for the lower section of the dome of the City Hall. The dome is to be made in three sections of twelve columns each. Three of these columns have already been cast; they are 32 inches in diameter and 32 feet 9 inches long, all finished off in a lathe at the ends. They are making three a week.

They are also getting out a stylish ornamental front for a saving's bank at Santa Rosa, which will be as fine a one as there is in any of our interior towns. The building is to be very strong, the whole front being made of iron.

Another item of interest in this foundry is the fancy light castings being made to ornament the interior of Latham's new bank on California street. The work is of a different description from any ever turned out in this city before. The castings are light but are finely made; they consist principally of heads of animals, etc., and great care is required in their manufacture; one particular moulder doing all the work on them. The shop is a light and commodious one, and while business is very lively there at present there is no confusion or crowding. The

Pacific Iron Works

Are turning out one of largest pieces of engine work ever made on this coast. The engine is an upright one and is being made for the Pacific Rolling Mills to run an additional set of rolls. The cylinder is 30x32, and will weigh about 7,000 pounds. The frame weighs 24,000 pounds, the bed plate 26,000, and the fly wheel 50,000 pounds. An upright engine of nearly the same size was made some years ago for the Savage mine by other parties.

At this foundry they are making water wheel machinery and additional barrels, etc., for enlarging the quartz mill of the Bajada mine in Sonora, Mexico. They are also making machinery for increasing the capacity of the Hornigner mill; there being the iron work for six additional furnaces and a four stamp battery to be added to the mill. They are refitting the Auburn mill at Reno, which is to be started up again under a new management. This is principally new pan work. They have lately been doing some iron work for the new ore reducing works of Wallbridge, and others in Brooklyn, Alameda Co. They are building some cane-sugar machinery to go to Mexico and doing the usual amount of small work.

Meeting of the Legislature.

The Legislature meets at Sacramento on Monday next, and under circumstances somewhat peculiar. The strong party ties which have heretofore separated that body into two distinct factions seem at the present time to be somewhat loosed, presenting a fine opportunity for the members of all parties to make for themselves a record in the interest of the people. In many of the counties throughout the State, very little attention was paid to party in the late election, and a large number of those elected were returned more on account of their fitness for the position, and their devotion to the general interests of the State, than for party fealty. Such a result augurs well for honest legislation the coming winter, and will no doubt exercise an important influence even upon hold-over members. It is to be hoped, and it is confidently believed that the present Legislature will prove one of the most popular that has ever assembled in the State. Already a marked disposition has been manifested by members, in their unorganized capacity, to arrange for a speedy presentation and dispatch of business, and it is to be hoped that the practice of former Legislatures, in devoting a large portion of the early days of the session in electioneering and conniving for a division of spoils and office, chairmanships and memberships of committees, etc., on the basis of partisan service, or for still worse considerations, will be altogether omitted, and the interest of the people at large, and the fitness of the candidates be the only considerations entertained. It is also expected that the usual plottings and manouverings on the outside, for jobs, special franchises, etc., will be suffered to come to grief.

The acts of this Legislature will be more carefully watched and scanned by the people, than has been the case with any which has preceded it. The people have become fully aroused to the necessity for holding their public servants more strictly responsible for their acts than heretofore, and they will do it.

There are many matters which will be brought forward, of unusual interest and importance in relation to the future prosperity of the State, which should be handled with much care and circumspection; and the people will watch with more interest than ever before the course which members take in the progress and dispatch of business. We have neither time nor space at this present writing to even allude to the numerous subjects to which the attention of Legislators will be called; but as business progresses we shall have more or less to say upon all matters of special interest to people.

In order that our readers may become familiar with the names of those to whom the Legislative interests of the State have been confided for the next two years, we herewith present a full and complete list of the members arranged by counties and classified, politically, by the Sacramento *Union*. This list will be found convenient for future reference, and for permanent preservation. The holdover Senators are marked with an asterisk (*).

Senate.

First District (San Bernardino and San Diego)—Jas. McCoy* (D.).

Second District (Los Angeles)—C. W. Bush (I.).

Third District (San Luis Obispo, Santa Barbara and Ventura)—W. J. Graves (D.).

Thanksgiving Day.

The day appointed by the President of the United States and the Governor of California as a day of public Thanksgiving, will have passed before this number of the PRESS will have reached its many patrons. It is too late therefore to suggest the manner in which a grateful people should express their dependence upon and thankfulness to the great Dispenser of gifts, for His kindness in bestowing the bounties of His providence upon them during the past year.

The observance of the day, from a small colonial beginning, amid the frosts and snows of New England, has finally extended its influence so wide—mainly through the migration of New England's sons—as to have given it a character but little less than national; and we hope that every farmer, miner, mechanic and manufacturer, and our whole people of every class and occupation, had as much of the good things of earth garnered up against a day of need or necessity, that he could on this day appointed join in heartfelt thankfulness therefor, and with a feeling that he could also dispense in free gifts a part of his fullness to his less fortunate brother.

Thanksgiving is really the beginning of the winter holidays, and we sincerely hope it proved a joyous one to all our friends and patrons.

Sonoma of California.

The town of Sonoma is the oldest one north of the Bay of San Francisco. The name Sonoma is of Indian origin, and signifies the Valley of the Moon. It was given to the valley of Sonoma on account of the great natural beauties of the place and for its shape as seen by moonlight. The name is peculiarly felicitous. This town is situated a short distance south of the base of the mountains, and about three miles from the place of shipment, the Embarcadero.

It was the chief pueblo of the native California population residing north of San Francisco up to the time of the settlement of the country by the Americans in 1846. Gen. M. G. Vallejo, acting under orders from the Mexican Government, in 1835 proceeded north of San Francisco Bay for the purpose of selecting a site for a town or pueblo, and locating said pueblo near the base of mountains or hills on which fortifications might be erected. On account of the beauty of the valley, the pleasant climate and fertile soil, Vallejo selected the present site of Sonoma. The establishment of the Northern Military Department was mainly caused by a desire to check the Russians and prevent them from encroaching farther south on the Mexican domain. The houses erected were built of adobe, around a plaza, after the old Spanish style. Many of these houses were abandoned by their owners, who had obtained grants from the Mexican Government, and retired on to the same, and furnished the main shelter for the immigrants of 1846. After the country was taken possession of by the United States forces, Sonoma was occupied for some time as a military post. Gen. Vallejo's palatial residence occupied the principal portion of the north side of the Plaza. The buildings were in the usual Mexican style; excepting on a large scale, the front, or main building was two stories high with a tower of four stories in the center of the building, the west wing of the front was not complete; in fact, the General had employed mechanics for years in finishing up the interior of the building long after the change of government. His brother, Don Salvador, had also erected a very large and commodious building on the west side of the Plaza, which has been built upon and occupied at times for various purposes, such as hotel, Masonic Hall, and at this time used for a wine cellar. Jacob P. Leese, the brother-in-law of General Vallejo, erected and occupied a large adobe building at the south-west corner, which still stands in good repair and is noted for being the headquarters of General Persifer F. Smith; General, or at that time Colonel Joe Hooker, Capt. Gibbs, Capt. Stone, Major Leonard, Paymaster, Major Phil. Kearney, Lieut. Derby *alias* Squibob, or John Phœnix, George W. Stoneman, Capt. Stone, afterwards General, of Ball's Bluff notoriety, Lieut. Davidson Williamson, and a host of United States officers. Many are still living and will long remember the happy hours they enjoyed while stationed at Sonoma Barracks.

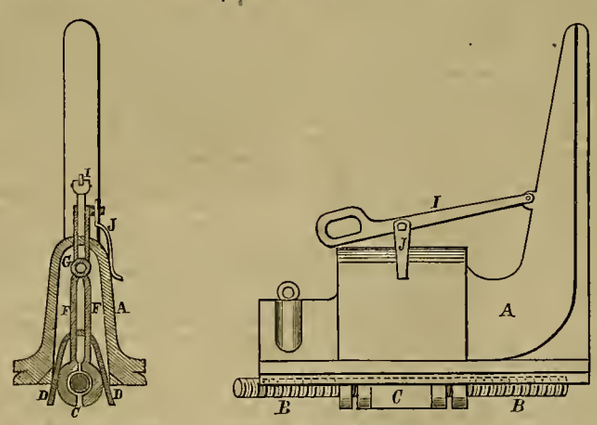
PLAZA AND BARRACKS OF SONOMA.*

*This engraving, with some of the facts accompanying it, is taken from Menlice's Sketch Book of Napa, Sonoma, Lake and Mendocino counties, now published by Haas Bros., Napa City, Cal.

Van Nostrand's Science Series.—D. Van Nostrand, the well known publisher, 23 Murray street, New York, is issuing a monthly series of valuable little publications, under the title of "Van Nostrand's Science Series." They are put up in a neat, uniform and attractive shape, 18 mo. size, and sold at 50 cents (currency) per number. The subjects are of an eminently practical character—scientifical and mechanical—and will embrace a wide range of topics. To give the reader some idea of the matters treated upon, we append the subjects of the first six issues. No. 1, Chimneys for furnaces, fire-places and steam boilers, by R. Armstrong, C. E. No. 2, Steam boiler explosions, by Zerah Colburn. No. 3, Practical designing of retaining walls, by Arthur Jacobs, A. B. No. 4, Proportion of pins used in bridges, by Charles Bender, C. E. No. 5, Ventilation of buildings, by W. F. Butler. No. 6, On the designing and construction of storage reservoirs, by Arthur Jacobs, A. B. Either or all the volumes will be sent by mail, post free on receipt of the price.

Huntington's Improved Head Block for Saw Mills.

The cuts shown on this page represent an improvement in opening and closing divided nuts, being more especially applicable to the nuts which are employed in connection with the screw used in saw-mills for moving the carriage forward in order to feed the log to the saw. When the half nuts are closed upon the screw they form a single nut so that the turning of the screw slowly feeds the carriage forward until the log is sawed through. It is then necessary to move the carriage back in order to take a fresh cut, and if the nut remained closed, it is plain that a considerable length of time would be occupied in doing so. In order to avoid this waste of time the half nuts are separated so as to leave the screw free. The carriage can then be run back without reference to the screw. The device shown in the illustration is intended to open and close this divided nut as occasion may require. *A* is the head block of a saw-mill carriage and *B* the screw by which the carriage is fed slowly forward as each cut of the log is made. This screw operates through a nut, *C*, which is made in two parts. In order to open and close this nut rapidly and firmly, two inclined arms, *D D*, form a saddle which sets down over the half nuts; one leg passing upon each side. On each leg of this saddle is a flange which passes beneath bent lugs, which are cast upon each half nut. Arms, *F F*, extend upwards from the half nuts, and are hinged together at some point above, as shown at *G*. Arms pass up through the head block, and are pinned to the lever, *I*, so that by raising the lever the saddle will be elevated, and as the arms, *D D*, spread apart at their lower end, they draw the nuts apart as they are lifted, and by pressing down upon the lever the saddle is forced down so as to press the nuts together by the two inclined legs. This device can also be applied to lathes and other machines where a long feed-screw is used for feeding in one direction only. The device is quite simple and is positive in its operation, and being constructed upon the wedge-principle a powerful pressure can be exerted to keep the nuts closed. This arrangement is the invention of F. A. Huntington, No. 145 and 147 Fremont street, in this city, and was patented through the Scientific Press Patent Agency.



HUNTINGTON'S IMPROVED HEADBLOCK FOR SAW-MILLS.

Recent California Patents.

Among the patents recently obtained through Dewey & Co's., Mining and Scientific Press, American and Foreign Patent Agency, the following are worthy of mention:

Mitre Box.—John P. Tiernay, Sacramento, Cal. In this invention Mr. Tiernay provides our carpenters and mechanics with a machine which can be used for making mitre joints with very little trouble. The machine is adjustable so that any desired level or angle can be given to the mitre.

Elevated Wire Way.—Henry T. Lantis and Nelson Davis, Atlanta, Idaho Territory. This is an improvement in the wire tram or rope-ways which are being extensively introduced upon this Coast, for transporting ores and other substances from one place to another. The improvement consists of an arrangement by which the load is suspended directly below the rope by a straight hanger, and yet is arranged to pass the pulleys which support the rope without hindrance. It is a very simple and neat device.

Watch Chain. — Henry H. Markley and Alphonse Matthieu, San Francisco, Cal. This patent is for a design for a watch chain, and it consists in employing a triangular shaped link, the sides of which are set or filled with quartz stone.

Mechanical Key and Sounder for Telegraphe.—David L. Parkhurst, San Francisco, Cal. This invention relates to a small telegraph key sounder for teaching the telegraphic alphabet and manipulations to learners. It consists of a thin metal plate, having a thin spot in it. This plate has one end secured in a frame while the other end is free. A lever is provided which has a projection or boss so arranged as to bear upon the plate. By depressing the lever, the middle of the plate is depressed so, to cause the thin spot to vibrate or buckle, and thus give a sound similar to the click of a telegraph key sounder. The upward movement of the lever allows the plate to spring back and repeat the sound.

Shoe Fastening.—Geo. L. Fitch and Henry M. Jones, Little Lake, Cal. This invention relates to an elastic shoe fastener to be used instead of laces or buttons, for fastening shoes upon the feet.

Burial Case.—Jerome B. Cox, San Francisco, Cal. This invention consists in securing the interior lead box or air tight case, which is usually placed inside of burial caskets, by passing its upper edges out between the seat of the lid of the coffin and the sides, and then soldering it to the roof or cover outside. This prevents the lead coffin from collapsing, as it usually does, and provides a perfectly tight seat for the lid of the coffin—a very comfortable arrangement.

Washing Fluid.—Nathan W. Lane, Mendocino, Cal. This is a cleansing compound and is claimed to be much superior to the washing fluids heretofore in use. It is said to be particularly valuable for cleaning painted surfaces.

Window Fastener.—William A. Hawetume and Edgar E. Scott, Carson City, Nevada. An improved device for securing and locking the lower sash of windows at any point of elevation. The arrangement is quite simple and neat, and appears to be effective.

Fruit Box.—Chas. W. Weston, San Francisco, California. This invention relates to an improved berry box, which is made of thin shavings or veneers of wood. The chief advantages consist of peculiar flap fastenings for securing the box in its folded condition, and in a peculiar stiffening rim. Mr. Westou is the inventor of several improvements in berry and fruit boxes.

Car Coupling.—Richard B. Buckner, of Gilroy, Cal. This invention relates to an automatic or self-acting car connector or coupling. The invention is quite simple and strong, and can be applied to both passenger and freight cars.

Veneer Key.—Geo. W. Swan, San Francisco, Cal. This invention relates to a key made of thin shavings or veneers of wood, wrapped around a cylindrical form and provided with heads at each end. A strip of canvas is wrapped around the exterior of the key and secured by any suitable adhesive substance. It makes a cheap key, and when lined with a lubricator, (which is also the invention of Mr. Swan) it can be used to hold liquids and other substances which are usually contained in keys.

Medical Compound.—Peter H. Steenberger. Chico, Cal. A cure for rheumatism and similar inflammatory complaints.

Mill Pick.—Morgan N. Young, Kelseyville, Cal. This invention relates to an improved method for securing pick points in the hammer head, so that the point can be removed to be sharpened or replaced by another one. It consists of a peculiar dovetail slot in the end of the hammer head, and in making the base of the pick point to correspond therewith; the point is then secured in place by being forced into the slot—a very cheap and convenient arrangement.

Peavine District, although not entirely new, is just now coming into general notice. It is situated some eleven miles northwest of Reno Nev. Some prospects were obtained from this place several years since but nothing of importance turned up until about a year and a half ago. The principal company now at work there is the Consolidated Poe Mining Co., who own some 3,000 feet of location. The Paymaster mine, belonging to them, is quite a large one, the ledge in some places being 30 feet between the walls, the assays from which go from $24 to $1,000 per ton in silver. The ores are free milling. The company have nearly completed a 10 stamp mill and have now between 400 and 500 tons of rock ready for working. John Poe is the manager and H. C. Toombe is the Superintendent.

The Stickeen Mines.

The Portland (Oregou) *Bulletin* says: The arrival of the steamer California from Sitka and way ports, has had the effect of awakening renewed interest in tbe recent gold discoveries in British Columhis. The intelligence she brings is of rather an exciting nsture, so much so, in fact, tbat the Yakima mines are for the time heing, almost forgotten. The mines are located on tributaries of Dease's lake, in the British Possessions. The route and distance from this city are as follows: From here to Victoria, 308 miles; from Victoria to Nanaimo, 74 miles; from Nanaimo to Fort Wrangle, 765 miles. At this point gold seekers leave tbe steamer, and by small boats proceed up the Stickeen river past Ice mountain, the last trading post of the Hndson Bay Company, Clearwater river and Shakesville, to Buck's Bar, 160 miles from the mouth. This is at present the hesd of navigation, up to wbich point small steamers—which are ss yet a myth, hut will become a reality should the minss hold out—can ascend.

From this point to Dease's lake, the route is an overland one, and it is on this portion of the road that the first real hardships of tbe trip are enconntered. The country from this on is hnt a succession of swamps, amid which foot passengers are apt to become hadly mired. This strip of the conntry will prove a great drawback until s regular trail is established, of which there is serious tslk already. A passage way of this kind ould he constructed without serious difficulty, and by reasonahle tolls, could, it is thought, be made a paying investment. The distance from Buck's Bar to tbe southern end of Dease's lake, is 160 miles, which is at present, as before stated, hardly open to foot travel, while in other places, navigation would not be out of the question, ss the entire route is but a succession of swamps and boggy land. After striking the lake, the distance to Dease's creek is bnt fifteen miles, while Tibbets' oreek, on which the mines are located, is but twenty-five miles frnther on. Desse's creek, as yet, hss been but partially prospected, but indications are very favorable. Near here, is the end of the lake, which narrows into and in tnrn empties into the McKenzie river, which hss bsen prospected for nearly 450 miles, and yields ahout six cents to the pan. It is, in fact, the general opinion of old miners, that the whole country along its hanks abonnds in rich ore.

The boundary line dividing the English from the American possessions, crosses the Stickeeu river ahout 100 miles above Fort Wrangle, thus throwiug the mines in the possession of the crown. Tibbets' creek, which at present is the headquarters of the mining district, is from 45 to 50 miles in length, and from 80 to 100 feet in width at the mouth. It empties into the lake from the uorth west, and fairly abounds with flattering indications. The Rath hrothers, who were fellow psssengers of Mr. Knott's from Wrangle to Victoria, made from eight to nine onnces per day, the gold in their claim being very coarse pieces, being fonnd worth from $5 to $27 each. Captain Moore and bis sons were the discoverers of the gold deposits on Dease creek. They worked in all about six weeks, with rockers, and left the diggings abont the 27th of September. The gold was found in bars and bed of the stream, and the Discovery company at no time reached bedrock. The Forest Rose company (two men), just above the Moores, averaged hetween eight and ten onnces per day for eight or ten days, and then hsd to leave for want of food. Rath brothers had run sluices on a limited scale in their claim, and had succeeded in washing out two hundred and fifty-eight onnces of gold in a little over five weeks' time, which may be considered pretty good wages for two men's lahor.

A recent Victoria paper, in speaking of these mines, says McGregor and Reynolds, on Tibhet creek, made $600 in eight or ten days, when they, too, had to leave and come out. George Williscroft and an Indian, on Dease creek, in the canon, took ont $179 in eight hours, and then had to lesve. Jim Hollywood, on the same creek, got thirty-two ounces in six weeks. Miller, in the canon, made an onnce a day. Wigg & Casey, helow the canon, made from four to five ounces a day. Captain Moore and his three sons, made from five to twelve ounces a day iu the gravel. The pay gravel is from four to five feet deep in Dease creek as far as known. There is a good deal of cement mixed with the gravel, snd the gold is rusty. The frost set in severely about September 24th, and snow fell in three days to the depth of eighteen inches. When the Rath brothers left Tibbet creek, ice was forming in that estream, hut there was no ice on Dease creek. Dease lake was partly frozen over when they left, but when the Fraser party went in to stake off claims a thaw set in, and the snow and ice had almost dieappeared. The health of tbe district was good. Fraser and party spent eight dsys in prospecting on Dease creek, and got prospects of from 25 cents to $2.50 to the pan.

There are at present but ahout twenty miners in the vicinity, although a number were met going up the Stickeen with their winter's grnb, while ahout forty were at Bnck's Bar, intending to pass the winter there. A numher of men intend starting from Victoria about the 1st of Jauuary, and transport supplies from Buck's Bar acrose the country on hand-sleds, which they consider csn be succesefully carried out. We were ehown some specimens of placer gold, purchased hy Mr. Knott, that were truly magnificent, and unusually free from imperfeotione of any kind. There is little donbt that the mines will yield handsomely. The estshlishing of a trail across the country is but a question of time, after which the rush to the gold diggings will be immense. Mr. Knott intends to return in the spring, having, it seems, unbounded faith in the fnture prospects. Meauwhile it will he the suhject of general comment on the whole northwest coast, for the gold fever is easily taken by the residents thereof. Our advice, which, by the way, is furnished gratis, is, don't get excited and, after a wild impulse, do what you will hereafter have cause to regret.

Advantages of Hydraulic Mining.

The following are extracts from a letter by Professor Silliman, pointing out the advautages of hydraulic mining, and especially referring to the Blue Tent:

"The affluents of the Yubs river have become proverbial for the excellent returns they have yielded to all legitimate undertakiugs iu hydraulic washing. Some of the largest fortunes in California have fallen to the lot of individnal owners and company organizatione working these deep-lying auriferous gravels of the Yuha. No comparatively virgin msss of auriferous gravel upon these waters can excel that hody of which the Blue Tent is an important psrt. You msy confidently assnre your friends that the Blue Tent property, properly and economically worked as contemplated in my report, will pay them 20 per cent. or 25 per cent. upon a capital of one million of dollars 'while water flows and grsss grows'—that is, for an indefinite time to come. To obtain this result they must supply and wisely use the working capital needful to bring forward the water in ample flow to do the work and open up the wsshiugs; nor must they fail to avail themselves of the hest skill and economy in management. Fortunately this skill is not difficult to attain in California, nor is it costly.

"The great powers of nature reslly do the work (as they have already prepared the material); the amount of human labor, therefore, needful for tbe direction of these powers is not large.

"I am certain that no person, however intelligent he may be in mining matters generally, and much less one wbo hss only a general knowledge of such suhjects, can form, without careful etudy, any adequate notion of tbe nature and extent of the deep-lying gold placers of California, and of the peculiar means by which the treasures they coutain are obtained.

"One view of the superior claims of this sort of miuing adventure, compared with deep mining in mineral veins, often presents itself to me, whicb I briefly state, as it may make the snbject more clear to your own mind.

"It is proposed, for example, to purchase and work a gold or silver mine. We will assume that such a mine has been opened by whst is esteemed iu the opinion of good miuers adequate exploration; shafts have heeu driven upon the course of the vein, thus opening up the ground to a considerable extent npon a deposit of the mineral. Several huudred, or it may be thousand, tons of ore have been extracted, milled or smelted, and the aversge value per ton has been ascertained hy actual working. The mining engineer now comes to view the property, scrutinising all the explorations; obtains his own mining samples for assay and working tests; he measures up all the ground which has been mined out and also the cubic contents of tbe vein matter which he sees and finds still standing, as well as the qnantity of ores already pnt out at tbe dnmps. From all tbese data, together with the teachiugs of his experience in regard to mineral veins and the probable future of mines, he prepares a careful statement of the actusl state of the property—what it has done, as shown hy the mining records (if he is so fortunate as to find any), and what it is probably capahle of doing. Let us suppose that he finds (a rare case indeed) a dividend-paying mine, with visible and measured reserves of ore worth in gross, say, one million of dollars, a reasonably good showing for the future, and pretty certain to pay steady dividends for two or three yesrs. At what value shall such a property he sold upon the market? Unfortunately this qnestion is rsrely put to the man who alone is the most competent to answer it. The mining engineer is regarded as having dischsrged his duty when he has rendered his report as to the actnal state and prohahle future of the propsrty, and he is not asked, 'How much capital will it do to pnt at peril in this adventure?' If he were eo asked, he could not with a good conscience eay tbat it was prudent to risk one dollar more than the probable net returns of the ore in sight. All the speculative value which msy be fonnd in tbe mines heyond what is in sight, is tbe rightful property of the new owners, who, wheu they huy, take the chancee of failure as well as betterment. It is an old Cornish adage, 'That no man can see further into a vein than the point of hie pick,' and we all know how often the anticipsted 'reserves' upon which calculations of profit are hssed, fall short of well-founded expectations. It is very nnfair for the disaffected adventurers to turn upon the scientific experts and charge them with carelessness or something worse. They knowingly enter upon an extra hazardons nndertaking, which has legitimate promise of extraordinary profits; but it is never to he forgotten that it has also an equal chance of being a great disppointment. This is true of vein mining the world over, snd nowhere are there more numerous examples in proof than in your own Cornwall.

"Per contrs, snppose thst in plsce of the exposure of the mineral vein we are considering at a few points by shafts and levels, its whole superficial area could be seen and examined over an area of many acres, such as might he exposed if we could conceive the mine laid down in a horizontal position, and its upper covering removed and its thickness determined. This would reduce the chances of error and miscalculation in mining to a minimum, and certainty would take the place of comparative uncertainty. This is precisely what we reach in hydraulic mining. We have a mass of known and messurable dimensions, over the whole area of which we may walk, and whose depth is readily messured hy ravines or workings, open to-day, and whose average valne in gold per cubic yard is determined, not hy the assay or milling of any limited and trifling quantity, bnt upon aggregates so large as to eliminste error and demonstrate a certainty. Here are no hard and flinty ledges to be hroken up no refrsctory chemical combinations of precious metals to he reduced, bnt pure gold in impalpahle dust or coarser grains intimately diffused in small hut wonderfully constant quantities. No labor of men's hands is here required to obtain tbe value, but a resort to the most simple, inexpensive and trnstworthy of natural agencies—to running water, gravity snd the elective force of quicksilver.

"It is true the element of speculation, which lends tbe powerful zest to tbe game of vein mining, is wanting in the gold hydrsulic mining; hnt how often, alas, does this speculative element fail to render us auy substantial return! It is precisely here that we find the reason why such important aress of gold-bearing deposits romsin unworked, or open to purchase at fsir prices, iu that they are not specnlative.

"In a new mining country people domand new and exciting adventures, where great prizes in the lottery of mines are mixed with numberless hlanks; and the fact that a certsin and moderate profit may he made by steady work at hydraulic mining is the sufficient reason why these trusty fields are neglected, or held in comparatively light esteem, while the crowd of adventurers rush off to new aud more tempting hut far more hazardous regions.

"In the Blue Tent property the most moderate estimates confirm the statement that 60,000,000 dols. of valne exist in the area named, within reach of the powers which control it. But a prudent estimate also fixes the probable net annual returns from this property at not more thsn 200,000 dols. to 250,000 dols. per annnm. The available flow of water is the practical limit to the average annual return.

"Compare these statements of reserved value and income from hydranlic gold mining, and the price at which such properties can he obtained, with the sums paid for even the very hest aud most certain of vein mines. It is esteemed prudent to pay for a silver mine, for exsmple, as much as the ores in sight will return, trusting to futnre discoveries to reward the adventurers with richer returns for the risks assnmed.

"The buyer of a good hydraulic mining property puts in jeopardy only a small percentage of the ascertained vslue of the ground he huys—it may be a sum equal ouly to five or six years' income. This income he can calculate with great probsbility upon the volume of water he owns or commauds, as I have shown in my report on the Blue Tent. Tbis circumstance is reslly the controlling one in fixing the value to be paid for these properties, since hy the use of the water alone can the reserves he made available, and tbis agent can be made useful only as the work of washing lays open new and otherwise nnavailable bodies of the gold-hearing gravel.

"When the permanent and thoronghly trustworthy character of these deposits come to he better known—and it is understood that they are good for generations to come as well as for to-day—they will rise in public favor steadily, and their valus will find expression in the constantly appreciating valne of the shares. This description of property ought to attract the attention of careful and prudent investors, and the more so, that it is not attrsctive to speculators."

SHARP PRACTICE.—In the case of Peter Brandow against A. W. Whitney, M. McDonsld, O. H. Bryaut, J. M. Byrne and W. H. Short, Judge Morrison has rendered judgment for the defendants. The complaint ststes that iu the month of December, 1870, the Virginia Silver Mining Company existed, and that the corporation owned no mills and no mines, except one situated in White Pine district, and which mine was not then, nor has it at any time since, been supposed to he of any considerable value. That on the 10th day of Decemher the officers of the company caused to be entered on the books of the company thst they had contracted for the purchase of mines of great value, located on Treasure Hill, viz., the Noonday mines. That the Virginia Silver Mining Company caused a resolution to be entered on the hooks that ite capital stock should be increased from $1,500,000 to $2,133,300, on account of its purchase. Plaintiff further states, that by reasou of the false representations of the defendants, that the company had purchased the mine as aforesaid, he was induced to purchase $3,325 worth of stock. Brandow helieves that the company never purchased the mines aforesaid, hut tbe defendants made the false representations for the purpose of "deceiving the people." The Court instructed the attorneye to draw findings in the case.

Chilian Method of Amalgamation.

THE first process employed in Chili was that of the ordinary *patio*, hut this was soon snpplanted by another method, which formed the hssis of that now in use. This consisted of treating rich snlphurets in copper vessels with cupric sulphate, sodiic, chloride and mercury. At the end of a little time almost the whole of the silver was amalgamated; being, however, only accomplished at the expense of the mercury, the loss frequently being 200 to 250 per 100 of silver; in spite of this the process was freqnently employed for the treatment of ores containing more thsn .002 per cent. silver, owing both to the rapidity of the operation, it taking less than two hours when aided by heat, and to the small percentage of metal (scarcely 0·0002 to 0·0003 per cent.) left in the tailings. The enormous amount of argentic chloride, iodide, and chloro-bromide, produced st Chsnarcillo soon demsnded a more rapid, though less exact, process than the old one. In order to obtsin some idea of the amount of ore requiring treatment, it will snffice to mention that the single mine of Descubridora produced in the years 1831-51 the sum of ninoty-three millions of dollars.

In the new process spplied to these ores, they were crushed and pulverised as in the old method. The pulverised ore was csrried by a stream of water to settling bssins of sheet iron, 6¼ feet in dismetsr and 8¾ feet deep. The stream was conducted in turn to different basins, which, when filled, were left to stand from eight to ten hours, to permit the slimes suspended in tbe water to settle at the hottom. At the end of this period the clarified water was decanted off and tbe slimes were transferred to tinas. These tinas consist of wooden vsts, having a cast iron bottom, and are 5 feet 10 inches by 3 feet 11 inches. They are provided in the line of their axes with a ehaft haviug iron arms which slide over the bottom of the vat. The charge placed in these tinas is about a ton and a half. The ores are a mixture of chlorides, iodides and bromides, having a gangue composed of the carbonstes of lime and haryta aa well as clay and oxide of iron. The charge of the vat was oompleted hy the addition of mercury, about twenty times as much of this beiug added as there is silver in the ore. The shaft was then set in rotation, making about four revolutions per minute. This operation lasted twenty hours, at the end of which the amalgamatiou wss snpposed to be completed. A stream of water was then introducsd snd the rotation coutinued. The slimes were removed by the water and carried into settling basins. When the water ran clear from the vats an orifice was opened in the lower portion of the vat, and the mercnry and amalgsm which ran out were received in a cast iron vessel, called cocha. Tbe amalgam was then squeezed in a thick piece of cotton and then laid aside for distillation.

The wsges, loss of mercury, and various expenses cost $9.30 per ton for ores containing less than 0·005 per cent. silver. The entire operation, including crushing, took about sixtcen hours. The tailings carrisd off by the current of water, and which were oaught in settling basins, contained 0·0008 to 0·001 per cent. silver, in the csse of ores of the abovementioned richness, snd never exceeded 0·002 for richer ores of the same character. The silver obtained contained scarcely 0·01 per cent. of impurities.

The process just described suhseqnently underwent several modifications. The time occupied in treating the ore in the vats, exclusive of lixiviation, was rednced to six hours; and ores were treated in this manner coutaining as high as 30 per cent. silver.

Owing to the increase in the proportion of sulphurets as the mines were snuk dceper, the results of the method of amalgamation just described nnderwent modifications; the percentage of metal in the tsilings behind augmented to snch a degree as to diminish the yield of silver.—*Mining World.*

A VALUABLE MINING DISCOVERY.—A valnshle vein of silver-bearing quartz has just been discovered on tbe east side of West Walker river, about 25 miles east of the Oreans mine (owned hy Winters, Hobart and others), Nut Pine Valley, and is about 15 miles from Wellington Station. The mine was discovered by a Mr. Edwards, who, in company with Thomas Alchorn, of this city, made a location of 1,500 feet on the lead. The vein ie from 10 to 20 feet in width and crope out for nearly a mile. Mr. Alchorn brought to this city several pouuds of samples tsken from various parts of the croppings. These were assayed by three different persons, and run from a few dollare well up into the thouesnds. Some of the assays are as follows, nearly all the valuable metal being silver: $1,302.25, $847.94, $227.91, $212.39. None of the assaye show gold at a higher rate than $15 per ton. The locatore of the mine are Mr. Edwsrds, Thomas Alchorn, William Skyrme, foreman of the Hale & Norcross mine, and Georg› Mock, proprietor of the Washoe Brewery. Their locstion is called the Edwards mine. But one other location (of 1,500 feet) has as yet been made on the lode. Mr. Alchorn eays the regiou is full of fine large veine, all of which present a very fine sppearance, and none of which have heeu prospected.—*Virginia Chronicle.*

The Lower California Placer Mines.

Wa are reliably advised that thera is to be a new order of things in Lower California. The authorities at La Paz obtained authentic information of the rich placer discovery long before it was fully known in San Diego. The *World* was the first jonrnal to give public information of a discovery that may prove of very material benefit tn onr city and section. We derived our informatiou from Mr. Pablo Pryor, who had largo bands of cattle in Lower California, which tbe pastures of the Boca de la Playa were this year nnable to feed. For our present information we ara indebted to Colonel Manuel A. Ferrer.

As soon as the anthorities at La Paz received intelligence of tha rich placer discovery, they were stimulated to undertaka a measure which they had long contemplated. This wae no less than removing tbe Cocopah Indians to a reservation. For tbis pnrpose a force of five hnndred men was organized, which was on the 10th of October started en route overland for the Frontera. The march will be necessarily a slow one, consuming a great deal of time, on acconnt of the fact that provisions, water aud avery necessary will hava to be packed. Immediately upon their arrival the Cocopahs will be removed from their immemorial hunting grounds to a suitable reservatiou.

The Cocopahs inhabit a mountain range in Lower Califirnia, which looks dowu ou the Colorado Desert, and extends for a great distance down the Peninsnla. Their territory rnns on to the Desert. They have always guarded it very jealously. When the Messrs. James and Purdy conducted au expedition to tha month of the Colorado, at tbe instance of Mr. Chapman and others, with the ostensible view of discovering the practicability of making the Colorado Desert a salt-water lake, with the benevolent object of modifying the climate, they enconntered the Cocopahs in force. The chief, Myorc, utterly forbade their passage through his dominious. After much entreaty he finally consented to allow them to pass, on the condition that they should put np their surveying implements and make no observations. They thus effected a hurrisd passage to the mouth of the Colorado.

The Cocopahs are a fiue, martial race of Indians, and, as near as can be asesrtained, there are between two and three thousand nf them. They are tall, and nse the primitive how and arrow as weapons. Breech-clouts and certain rnstic ornaments, with blankets, make up their aquipment and apparel. They are brave and good-humored, but resent any attempt to penatrate their country,

It has long been known that the Cocopahs have had access to gold. In the old days, and at intervals up till data, they have been in the habit of going to Yuma and paying for their goods with dust and chunks of gold. In the time when Hinton used to keep store at Yuma, parties of Indiane were wont to make their way to his place and barter gold for goods. He frequeutly endeavored to fiud out where they got the gold, but insffectually. Their habit was, also, to ornament themselves with rare gems of virgin gold.

Some years ago a Cocopah Indian came to Dr. D. B. Hoffman, of this city, and showed him a large lnmp of gold. The Indian affected not to know what it was. The Doctor told him, and made him a very liberal proposition. This was that if the Indian would show him (the doctor) where he had fonnd the treasnre, he (the doctor) would keep him during the period of his natural life. The Indian said that he wonld have to go home to his tribe and obtain the consent of bis chief. He never returned.

The fact that the Mexican Government is beginning to turn its attention to Lower California is shown by the detailing Señor Blanco to make a prolonged recouuoissance of the Frontera, which was done in the latter part of last winter. The movement of troops from La Paz has followed that and the discovery of the placers. If the statement made by Peters is true, that he prospected in the Cocopah mountains fifty or sixty miles from Japa, and tbat he found very rich placers in the mountains, as well as running water and abnndant wood, why, then, takan in connection with the removal of the Cocopahs, and putting them on a reservation, we are going to have lively times and a new era of development in Lower California, and an unpreeedented activity in San Diego.

Parcels of gold are reaching San Diego daily. Experts pronounce it a very fine quality of float gold. It has evidently been washed from a distance. Jesus Marron, who is driving a stage to Japa, arrived from that section yesterday. He informs us that there are about two hundred people on the ground, and that he connted fifty on the way there as he came up. He says that everybody who is not too lazy to work can make money at the placers, although he has to pack his dirt two or three miles to water. In addition to Marron's information, Judge Chicon writes to Colonel Ferrer that, besides the Japa diggings plenty of gold is also being discovered at Socorro El Topo and El Caballo—the latter about fifteen miles from Japa. The Judge says that ohunks of it are picked up, and that the diggings are exceedingly rich.

Per contra, the Messrs. Sampson Miller and Jamee Allison, who epent a day or eo at Japa, and have just returned, tell ns that there is gold there, but not in sufficient quantitiee to pay. They say that the ocuntry is a bastard granite formation. They don't think the quartz would pay. They think that thirty or forty men might maka something, but that a larger numbsr would he ont of place. The Messrs. Miller and Allison aro the nnly persons frnm whom we have hsard an adverse report. From every other source the accouuts of the district are most flattering. The one patent fact remains—gold is coming in, Mr. Wash Jacobs alone having brought teu ounces with him. It is bright and polished gold, some of it in scales of considerable size. Two Mexicans of Japa have a rawhide nn ekids, and a fnule. They haul one day and wash the next, and each makes, wa are informed, six dollars a day. If this be true, the diggings are all that is claimed for them.—*San Diego World.*

THE ST. GOTHARD TUNNEL.—The journal of the Society of Arts reports that tho works of the St. Gothard Tunnel are progressing rapidly. On the 25th of last month 5·90 mstres of heading was driven at the Ariolo, and on the following day the amonnt of progress made was six metres. The contractor, M. Favre, to enconrage tha workmen, has wisely offered a premium to the miners should the length driven exceed that established by him as a proper day's work. The great difficnltics that wera met with at first from tho quantity of water, which hindered the progress of the work of tunneling at this end, have in a great measure been overcome; and as the length of heading increases there is every reason to anticipate that very little water will be met with. The tnnnelliug machines used at this side are those kuown as the system Dubois and Francois, and are similar to those adopted by the "Socictie de Charbon de Maribayc," and by the "Companie pour l'extraction de l'huile minerala a Anzin." The total length of these machines is 2·20 metres; their width, 0·23; and hight, 0·32. The diameter of the cylinder is 0·07, and weight, 220 kilogrammes. Six of these "perfomtors" are mouuted on a carriage, similar to those used at the Mont Cenis tnnuel, running on rails, which are laid down as the work proceeds, and worked hackward aud forward as reqnired by the little locomotive "Tessin."

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issned, wholesalo and Retail, by DEWEY OO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on tbe treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives sbort and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contaiue 142 pages, embracing illustrations of furnaces, implements and working apperatns.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally. witb 120 Lithographic Diagrams. 1867.

This work is nncqualed by any other published, embracing tho subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workere in ores and minerals, which cannot be found olsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of tbe greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a dcscription of tbe general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both tbe moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leatbor—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M.D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & Co., Mining and Scientific Press Office, S. F.

A Good Binder for $1.50.

Subscribere for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preservee the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) nsed continnonsly for subsequent volumes. Post paid, 25 cts. extra. It can be nsed for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them witbin 30 days. Just tha thing for librariss and reading rooms, and all who wish to file tbe PRESS. lambp

The Mining & Scientific Press

Started in 1860, is one of tha oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly enlarged and constantly improved. The activa and steadfast efforts of its publishers have gained for its conduct an amonnt of practical experience greater than any other publishers hava accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special ciass jonrnal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rival on tbis Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of tbo Pacific States.

Every Miner, Assayer, Millman, and Metallurgist in tbo United States should take it.

Every Pacific Coast Mechanic, Engineer, Inventor, Manufacturer, Professional Man, and Progressive and Industrial Student should patroniza its columns of fresh and valuable information.

Every Mining Engineer, Superintendent, Metallurgist, Mine Owner and Mine Worker in the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Every intelligent thinker in the land, in high or bumble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

DEWEY & CO.,

DEWEY & CO.,
American & Foreign Patent Agents,
OFFICE, 338 MONTGOMERY STREET, S. F.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influeuce of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain Patent,

well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & Co., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send $15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, auswer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS AND INSTRUCTIONS regarding the RIGHTS AND PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

Diseases of a chronic and obstinate character, especially such cases as have for years, or a lifetime, resisted the ordinary modes of treatment, are the class of maladies in the treatment of which Dr. Aborn has become pre-eminent on the Pacific Coast, as well as throughout the Union, and by his success has acchieved for himself an enviable reputation. 23v25-1y

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., November 25th, 1873.

FOR WEEK ENDING NOV. 11TH, 1873.*

MACHINE FOR CUTTING COBBLE STONES.—Hezekiah Lombard, Joseph P. Morrill and Leroy A. Sweatt, S. F., Cal.

OFFICE AND COUNTING-HOUSE STOOL.—Alfred De Forest Cartwright, S. F., Cal.

———*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office, San Francisco:

KEARSAGE QUICKSILVER MINING CO.—Nov. 20. Location: Lake county. Trustees—John C. Hanscom, E. T. Armstrong, Wm. Amesbury, Seth Dunham and D. W. Lilly. Capital stock, $4,000,000, in shares of $100 each.

CHALLENGE CONSOLIDATED M. CO.—Nov. 20. Location: Gold Hill Mining District, Storey county, Nevada. Trustees—Wm. Sharon, James H. Dobinson, J. D. Fry, A. K. Harmon and James Freehorn. Capital stock, $5,000,000, in shares of $100 each.

PIOCHE WATER CO.—Nov. 24. Object: to supply all persons and corporations in Pioche, and within a radius of ten miles of the town, with pure fresh water for all purposes. Trustees—L. L. Robinson, Oliver Eldrige, Irving M. Scott, Charles J. Brenham and Maurice Dore. Capital stock, $100,000, in two thousand shares of $50 each.

PANAMINT MINING CO.—Nov. 24. Location: Wonder of the World claim, Panamint District, Inyo county. Trustees—James Palache, Richard C. Jacobs, Charles P. Schmidt, Gustave Wiss and Henry W. Schmidt. Capital stock, $2,000,000, in 20,000 shares.

The Most Popular Medicine Extant.

1840. Over 30 Years, 1873.

SINCE THE INTRODUCTION OF

PERRY DAVIS'

PAIN-KILLER,

And after thirty years' trial, the "PAIN-KILLER" may justly be styled the great medicine of the world, for there is no region of the globe into which it has not found its way, and none where it has not been largely and highly prized. Moreover, there is no climate to which it has not proved itself to be well adapted for the cure of considerable variety of diseases; it is admirably suited for every race. It has lost none of its good name by repeated trials, but continues to occupy a prominent position in every medicine chest; and is still receiving the most unqualified testimonials to its virtues from persons of the highest character and responsibility. Physicians of the first respectability recommend it as a most effectual preparation for the extinction of pain. It is not only the best remedy ever known for Bruises, Cuts, Burns, etc., but for Dysentery or Cholera, or any sort of bowel complaint, it is a remedy unsurpassed for efficiency and rapidity of action. In the great cities of India and other hot climates, it has become the Standard Medicine for all such complaints, as well as for Dyspepsia, Liver Complaints, and other kindred disorders. For Coughs and Colds, Canker, Asthma, and Rheumatic difficulties, it has been proved by the most abundant and convincing testimony to be an invaluable medicine. No article ever attained such unbounded popularity. As an external and internal medicine the Pain-Killer stands unrivalled.

Thirty Years are certainly a long enough time to prove the efficiency of any medicine, and that the PAIN-KILLER is deserving of all its proprietors claim for it, is amply proved by the unparalleled popularity it has attained. It is a SURE and EFFECTIVE remedy. It is sold in almost every country in the world, and is becoming more and more popular every year. Its healing properties have been fully tested, all over the world, and it needs only to be known to be prized. Be sure you buy none but the genuine, manufactured by PERRY DAVIS & SON, Providence, R. I.

Sold by all Druggists. nov8

ONE HUNDRED DEATHS PER WEEK in New York and Brooklyn from disease of the throat and lungs! Is it not awful! And yet *Hale's Honey of Horehound and Tar*, taken in time, would prevent seven-eights of this frightful mortality. No cough or cold can resist this balsamic remedy. Crittenden's, 7 6th Avenue. Sold by all Druggists.

Pike's Toothache Drops cure in 1 minute. *

NO LIFE INSURANCE COMPANY has a better record or more permanently popular reputation than the CONNECTICUT MUTUAL LIFE INSURANCE CO. J. B. Roberts, 315 California Street, San Francisco, is general agent for this Coast. Send to him for circulars and information of this reliable, first-class company.

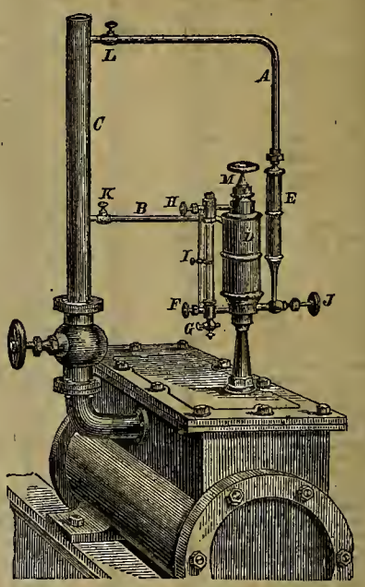
Machinery.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

---

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand,

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

For further particulars apply to

R. HOSKIN, Dutch Flat,
R. R. & J. CRAIG, 304 Montgomery st., S. F.
Or WILLIAMSON & CORY, Marysville.

Dutch Flat, August 1, 1873. 6v27-2m

CROCKER'S PATENT TRIP HAMMER QUARTZ BATTERY.

This machine, complete, weighs 1,500 lbs. Has an iron frame, five steel arms with stamps weighing 17 lbs. each, which strike 2,000 blows per minute, in a mortar provided with screens on both sides, and crushes FIVE 500 lbs. per hour, requiring one-horse power to drive it. Has been thoroughly tested, and is guaranteed to give good satisfaction. PRICE, $600.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

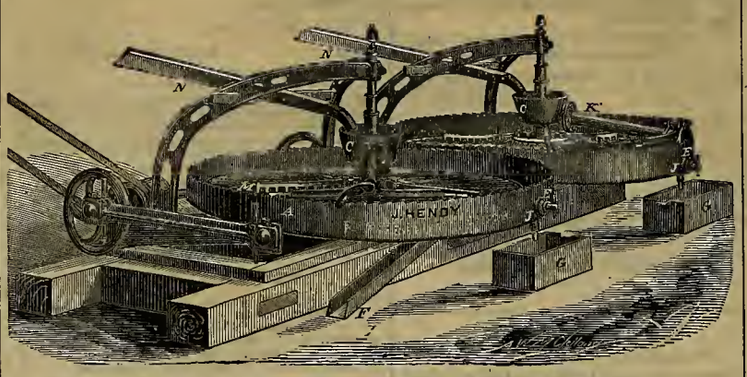
HENDY'S

LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.



Can be seen at the Manufactory, 32 Fremont Street, San Francisco.

SAN FRANCISCO, April 27, 1872.

JOSHUA HENDY, ESQ.—*Dear Sir:*—As a practical miner and millman, I take pleasure in recommending the use of your Concentrators in all mills where gold or silver ores are reduced. No mills should be without them for the following reasons:

1st. They are good sizers (no perfect concentration in pulverized ores can be effected without first sizing).
2d. The best Concentrator I have ever known—(the concentrated stuff only containing 5 per cent. of sand).
3d. They are good amalgamators, light (feathery) particles of amalgam and particles of coated gold, by attrition are brightened, and from their specific gravity and the action of the pan, fall to the bottom and adhere.
4th. They require but little power and attention to run them, and with ordinary care will last for years.

I have been familiar with the workings of your Concentrators for four years past; have run them myself in the North Star Mine, Grass Valley; am familiar with their practical workings on the Empire Mine, Grass Valley; St. Patrick, Placer Co.; St. Lawrence, El Dorado Co.; Oaks and Reese, Mariposa Co., and most cheerfully give you this testimonial. For further information you are at liberty to refer to,

Yours respectfully,
JAS. H. CROSSMAN, M. E.
409 California street, or Cosmopolitan Hotel.

BLANKETS VS. CONCENTRATORS.—The Keystone Consolidated Mining Co., located at Amador, Amador county, Cal., have recently taken out the blankets in front of the battery and substituted twenty of Hendy's Concentrators. Sixteen of the Concentrators take the tailings direct from the batteries and the remaining four re-concentrate the pulp from the sixteen. The latest report from the mine is that they do away with the labor of six or seven men who were formerly employed with the buddles and blankets, and in addition the concentrators save about half a ton of sulphurets daily.—[Mining and Scientific Press, Sept. 6th, 1873.

ST. PATRICK MILL.....Newcastle, Placer Co.
JULIAN MILL.....Newcastle, Placer Co.
VIRTUE MILL.....Oregon.
KEYSTONE MILL. (22 Concentrators).....Amador Co.

CAUTION—All of HENDY'S PATENT CONCENTRATORS are marked thus: "J. HENDY, Patented April 17th, 1866, and May 19th, 1868."

For full description send for Circular. Orders or letters of enquiry, address,

JOSHUA HENDY, San Francisco.
Office and Works, 32 Fremont street. 22v27-1am-tf

CAST STEEL SHOE AND DIE COMPANY,

OFFICE—Room 28, Hayward's Building, 419 California St., SAN FRANCISCO.

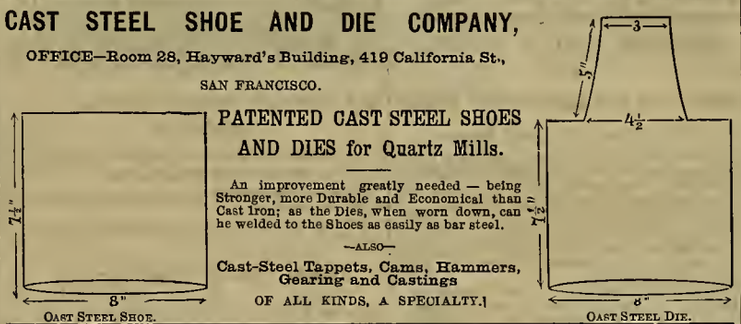
PATENTED CAST STEEL SHOES AND DIES for Quartz Mills.

An improvement greatly needed — being Stronger, more Durable and Economical than Cast Iron; as the Dies, when worn down, can be welded to the Shoes as easily as bar steel.

—ALSO—

Cast-Steel Tappets, Cams, Hammers, Gearing and Castings

OF ALL KINDS, A SPECIALTY.



CAST STEEL SHOE. CAST STEEL DIE.

GIANT POWDER.

Patented May 26, 1868.

THE ONLY SAFE BLASTING POWDER IN USE.

GIANT POWDER, NO. 1,
For hard and wet Rock, Iron, Copper, etc., and Submarine Blasting.

GIANT POWDER, NO. 2,
For medium and seamy Rock, Lime, Marble, Sulphur, Coal, Pipe Clay and Gravel Bank Blasting, Wood, etc.

Its EXCLUSIVE use saves from 30 to 60 per cent. in expenses, besides doing the work in half the time required for black powder.

☞ The only Blasting Powder used in Europe and the Eastern States.

BANDMANN, NIELSEN & CO.,
20v22-3m18p General Agents, No. 210 Front Street.

ANDREW OBALD, A. C. PUTNAM. | JAS. W. WHITLATCH, JNO. L. MURPHY.

The Californfa Ore Crushing and Sampling Company,

Nos. 413 and 415 Mission st., San Francisco.

Our works are the largest, and afford the best facilities for CRUSHING and SAMPLING ORES on the Coast. Work done at the Shortest Notice.
Prompt attention to all orders. 22v27-3m

VALUABLE
MILL AND MINING PROPERTY
For Sale.

Proposals for the purchase of the Mill, Furnaces and Mines of the Mendba Silver Mining Company, situated at Highland, (near the town of Piocho) Lincoln county, State of Nevada, either as a whole or separately, will be received by the undersigned, at their office, Room 21, 411½ California Street, San Francisco.

HENRY C. HYDE,
W. A. SCOTT, JR.,
Assignees of the Mendha Silver Mining Co., Bankrupt.
Dated San Francisco, Nov. 14, 1873.

THOMAS O'BRIEN. JOSEPH M. KINLEY.
KINLEY & O'BRIEN,
Attorneys-at-Law—712 Montgomery Street.
☞ Questions pertaining to Mechanics' and Inventions receive especial attention.

W. T. GARRATT & CO.
CITY
Brass and Bell Founder,
Corner Natoma and Fremont Streets,
MANUFACTURERS OF
Brass, Zinc and Anti-Friction or Babbet Meta
CASTINGS,
Church and Steamboat Bells,
TAVERN AND LAND BELLS, GONGS,
FIRE ENGINES, FORCE AND LIFT PUMPS.

Steam, Liquor, Soda, Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder and Copper Rivets, etc. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles. HYDRAULIC PIPES AND NOZZLES for mining purposes. Iron Steam Pipe furnished with Fittings, etc. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."
☞ Highest Market Price paid for OLD BELLS, COPPER and BRASS. 6-tf
W. T. GARRATT, JAMES HILLMAN, W. T. LITTLE.

N. W. SPAULDING,
Saw Smithing and Repairing
ESTABLISHMENT.
Nos. 17 and 19 Fremont Street, near Market.

MANUFACTURER OF
SPAULDING'S
Patent Tooth Circular Saws.
They have proved to be the most durable and economical Saws in the World.

Each Saw is Warranted in every respect.
Particular attention paid to construction of
Portable & Stationary Saw Mills.
MILLS FURNISHED AT SHORT NOTICE
At the lowest Market Prices.

HALLIDIE'S
Patent Endless Wire Ropeway.
Covered by Numerous U. S. Patents.
IMPORTANT TO
Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN - My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freiburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get ont of order—nothing to wear ont. While ours requires hnt about two thonsand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be donbled or qnadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, O. O. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO., Little Cottonwood, Utah, Superintendent's Office, Sept. 23, 1872.

T. M. MARTIN, ESQ.—SIR: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully, L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,
113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions furnished at lowest rates. A. S. HALLIDIE 113 and 115 Pine St.

MINING AND SCIENTIFIC PRESS.

SAN FRANCISCO, SATURDAY, DECEMBER 6, 1873.

VOLUME XXVII. Number 23.

Concentration of Ores.—California Mills in Europe.

The jigger as represented in Fig. 2, in our last issue, has two sieve compartments, but there may be three or four in one combination and so arranged that each sieve should be placed one inch and a half higher than the preceding one. The jiggers, if continuous, like those represented by Fig. 2, require a good deal of water. As soon as the pistons are set in motion, the ore is allowed to run on the first sieve, *a*; the short and pulsive action of the water in very quick succession lifts the ore above the sieve which sinks in the next moment, but is thrown up again before it can fall through the sieve; the heavier particles, however, find their way through and sink on the funnel-like lower part. The lighter particles keep on the surface of the mass and are carried by the flow of the water over the partition on the next lower sieve, *b*. The process here is the same as on *a*. The valve, *d*, is kept shut till a certain amount of concentrated ore accumulates, or if there is an abundance of water the valve may be opened but only as much as the proportion of concentrated stuff admits. A better result is obtained, if coarse concentrated ore from other jigging operations is spread upon the sieves two or three inches high before the fine ore is admitted. The coarse ore, about ¼ of an inch in diameter, is of course much larger than the holes in the sieve and prevents the fine ore from reaching the sieve too soon. By this means the small but heavy ore particles penetrate the coarse strata and fall through the sieve, while the earthy light stuff is kept above the coarse ore from the start.

The introduction of the jiggers in Pribram in place of the continuous percussion tables is a great improvement in concentration, first, because a jigger is a great deal cheaper to build than the table, and the concentration itself is more perfect and requires much less attention. The loss is now considerably reduced by the use of jiggers for fine ore, so that nearly 90 per cent. is obtained from galena ore if everything is properly attended to.

A corresponding progress in the line of crushing is not observed in Pribram. The old fashioned wooden stamps are still in use and the only thing that may be considered an improvement, is in the iron guides on each stem running in an iron groove on the wooden cross beam, which we term here the "guide." The iron guide improvement is exactly the same as was fixed on wooden stamps at Mount Ophir, Mariposa county, in 1857. But the most singular fact, is that about six years ago a battery was tried with rotating iron stamps after the California style, and compared with a wooden one, weight of stamps, lift etc., being equal in both; although the discharging was a little in favor of the iron stamps, as well as the wear of the shoes, after the trial was over, the iron battery was condemned as "not recommendable." With the report appeared a drawing, like Figs. 1 and 2, shown on this page, for illustration. The reason the battery was condemned was "that the cam in course of action, during the lift attacks the tappet with a constantly decreasing face till at the end of the lift, as Fig. 2 shows. The tappet hangs only on one part of the cam by which shape it is rapidly changed; also the tappet and screw of the stem wear out in a short time so that the expense of keeping such a battery in order, and the higher cost of construction would counterbalance the advantage in crushing."

This conclusion is somewhat startling to people familiar with our quartz mills. If the gentlemen had paid more attention to published particulars of the construction of our mills they might have appreciated them better. If they had noticed the description of California stamps in the Freiburg *Berg und Hüttenmanische Zeitung*, in 1864, with detailed drawings, they would have found different results; fastened the tappet with the jib in place of the expensive and stamp-weakening screw. They would have made the tappet with both sides alike so as to use the upper part after the under side was worn out. They would also have cut off the obstructive points of the cam according to the end of the tappet and would have constructed the cams so as to place the shaft much nearer to the stem. Inexperience and prejudice deprived Pribram of a great advantage in crushing as compared with their primitive rattletrap, at a point where circumstances were in favor of their seeing their mistakes.

The California stamp mill is almost universally conceded to be the best contrivance known for crushing ores. The people on this coast

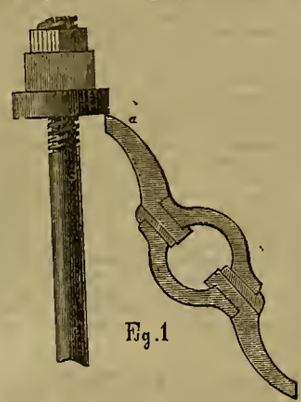

Fig. 1

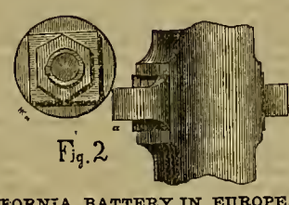

Fig. 2

CALIFORNIA BATTERY IN EUROPE.

have had abundant experience in milling operations and have taken advantage of every improvement possible to perfect their mills. We do not doubt that if some of these Pribram sharps were to walk into a first class mill somewhere on this coast, they would be considerably astonished to find out how far they were behind the age.

The miners who went from Julian city, San Diego county, to the Japa mines in Lower California, have nearly all returned. They state that with the present scarcity of water the miners cannot make more than "grub." Lower California is a pretty hard country.

G. F. Kelloog, retiring foreman of the Crown Point mine, was last week presented by the employés of the mine with a set of diamond sleeve buttons and shirt studs worth $1,000. It's a good thing to be a good foreman of a good mine.

A Committee from House Carpenters' shop No 3, to confer with others from the different associations in this city as to the best plan to bring about the establishment of public drinking places, has been appointed.

The Washington Telescope is now being mounted in the National Observatory at Washington. The object glass is twenty inches in diameter.

The Comstock mines ship about 90 car loads of ore daily by railroad to the various mills.

The Hoosac Tunnel.

The completion of the cutting in the Hoosac tunnel on the 17th ult. opens a new through route from the Hudson river to Boston, having its western terminus at Troy. The tunnel is four miles and three quarters long, twenty-four feet wide and twenty-six feet high. The Mont Cenis tunnel is about seven miles long, but the refractory rock in the Hoosac made it a much more difficult job to finish. The latter was begun in 1850, but was temporarily abandoned and recommenced several times, until in 1869, a contract was awarded to complete it within five years. Since then no interruption in the work has occurred. Steam and air drills and improved explosives have much facilitated matters, but the work has nevertheless cost the State of Massachusetts some $12,000,000.

The blasting agent used was principally nitroglycerine — made on the spot were used. The drilling has been effected by the Burleigh drill, and the power used was the atmosphere, compressed to a pressure of from fifty-three to sixty-five pounds on the square inch, serving the double purpose of working the machinery and supplying oxygen to the hundreds of men employed in the work. From their commencement under the present contractors, the works have been carried on without interruption (save the twenty-four hours of Sunday), night and day, each day being divided into three "shifts" of eight hours each. The width of the tunnel will admit of the laying of a double track. Three shafts were dug, and work was carried on on several faces at once. The central shaft is 1,030 feet deep.

The Mount Cenis tunnel is seven miles long. The St. Gothard tunnel will be nine miles long, and the contractors at work on it are under heavy penalties to complete it in nine years. The Sutro tunnel, to tap the Comstock lode, in Nevada, is to be 19,790 feet, or about three and three-quarter miles in length. This is a mining tunnel, and already upwards of 5,400 feet have been completed. The work is progressing rapidly.

Where the Lumber is to Come From.

The *Wisconsin Lumberman* wishes to know how the future demand for lumber is to be supplied. The Atlantic States are already nearly bare of forests, and the great prairie States, with no lumber at all, are rapidly filling up with a great population, that will require immense quantities, and to supply all this, there are only the comparatively scant timber lands of Wisconsin and Michigan, and the writer thinks that in consequence of the rapid manner in which the lumber of these States is being used up, that not a dozen years will be passed before there will be a scarcity, and that a hitch in the increase of the rates of manufacturing must ensue. Now, our brother of the northwest forgets that there will be some other lands to supply than those within the United States; he reckoned not of the fertile prairie of the Saskatchawan, which will be filled by an industrious race of agriculturists, and he forgets the existence of the pine woods of Canada. But more than all, he forgets that within the United States, there could be sufficient lumber grown to build all the houses and fences that shall be ever needed in the Union. Nay, the forests of the Sierra Nevada and the Coast Range, for 3,000 miles in length, can furnish lumber for the whole continent for untold centuries. California, Washington and Oregon will henceforth supply the wants of the United States, and instead of making 300 million ft. yearly, in a dozen years they will need to make three thousand million feet, and our city will derive as much benefit from its lumber trade as has done Chicago.

Our Mining Laws.

The United States mining laws of May 10th, 1872, have naturally made a great difference in the method of location of claims, and the change does not please everybody. The clause which gives 1,500 feet in length on a vein to any one man, together with 300 feet of ground on each side of said vein, was manifestly inserted for the benefit of poor miners. There is considerable doubt whether this clause has worked as beneficially as it was expected to do. It is perfectly certain that it tends to retard the development of the country to a great extent. In almost all the new districts, the first men who come locate their claims and really hold the mineral land in ranches, so to speak. This puts the ownership of the district into a very few hands. The tracts are 1,500 feet long and 600 feet wide, and it takes very few men to cover a whole district.

Whenever a new district is struck, the nomadic prospectors must go there immediately, in order to get possession of ground. The first arrivals locate all the ground, and leave no more for others. By this means men are induced to travel around from one place to another, more than used to be the case, although the custom always has been a bad one. They do not want to wait now to have a district prove itself worth something; the simplest assertions of richness are enough to excite droves of miners. There are hundreds of men now rushing to the San Juan country in the dead of winter, so as to get possession of all the land they can, before the crowd comes in the spring. Many of these will pass a hard winter, and be disappointed in the end.

Of the miners who locate a broad tract in a district, not one in a thousand is able to develop the ground to any extent. Men will not prospect on the ground on either side of a located ledge, and the owners having one vein and a title to the area on each side are never in a hurry to prospect outside the discovery claim. The whole system, will, without doubt, eventually lead to considerable litigation.

The "tunnel site clause" also comes in for its share of abuse. It encourages wholesale grabbing and retards development. As the law now stands, when one company locate a tunnel site at the bottom of a hill, they virtually take possession of the hill and all its ledges. Miners will not prospect across the line of a proposed tunnel, and not one tunnel in twenty is ever finished. They do work enough to cover the law, and if any hapless miner strikes a lead they will push their hole ahead of them and gobble his claim. The miners know what to expect and dodge hills with tunnel locations upon them. There is certainly fault in a law which keeps the miners from prospecting and gives so much power to one man or company of men. The complaints are not confined to any particular district, but are wide spread; the newly discovered districts being the worst off. Monopolies of all kinds are objectionable, but when a few men can keep ten times as many from equal rights, and have the law on their side at the same time, that law wants changing. The worst feature is, however, that the system as at present pursued discourages prospecting and retards mineral developments.

The Yellow Jacket and Crown Point works are being connected with the large cistern on the hill, overlooking Crown Point Ravine, by a six inch pipe, as a precaution against fire.

Hill's Separating Works.

As statsd in onr brisf sketch of Monday evening, Gilpin county is now fairly entitlsd to the prestige of hsving the only works on the American continent cspable of treating the product of our ores known as copper matte, by which is meant the powsr to extract therefrom the precious metals—gold and silver. Aftsr two months of preparation, Prof. Hill, through the assistancs of Richard Pearce, Esq., late of Swansea, Wales, than whom there is no more skillful opsrator in this complex businsss in the world, has complsted his extensive establishment, and is now conducting, in oonnection with his smelting furnacss, the process of ssparating the results thereof into thrse distinct parts—gold, silver and copper. Hitherto these results could only be obtained in England, and therefore the matte has been shipped there for thst purnoss. Owing to ths lsts heavy advances in the cost of cosls snd skilled lsbor abroad, compelling a corresponding increase of rates for treatment, it was deemed advisable to attempt the construction and opsration of similar methods here upon our own soil. By this means, the experiment having proved more successful than its sanguine projectors had ever predicted, the enormous returns of bullion annually taken from ores hy the Boston & Colorado company will be passed to our credit by the compilers of statistics, instead of heing entirely lost or left to conjecture. The first return was made on Monday in five bars of pure silver, weighing 5,480 ounces. For the trial test, material of the lowest grade was selected from the large stock on hand. So perfect was every part of the intricate machinery arranged by Mr. Pearce, that from the moment of starting every department has performed its work without alteration, and to the infinite satisfaction of the builders.

The motive power is supplied by a fifteen horse power engine. This with the boiler attached occupies the extreme northern wing of the building. Thence, under the guidance of the Superintendent, we were ushered into the pulverizing room, where the crushed matte is reduced to an impalpable powder by means of a revolving cylindrical machine filled with iron balls, and with which all our resident readers are familiar. The material is thrown into the hopper, whence it is conveyed to the pulverizer, which, for the preservation of dust and the comfort of the workmen, is hermetically sealed within a square box of sufficient dimensions. From the point of discharge the powder is put through the process of calcination in two large reverberatory furnaces for the purpose of converting the sulphides into sulphate of silver readily soluble in water. After remaining subject to a steady heat four or five hours, the charge is spread out on the floor of a brick-lined cooling room preparatory to its transfer to the tub room and the process of precipitation. The capacity of the calciners is six tons per day. Ample dust chambers of hrick are attached for the reception of such particlea as may be carried off by the draft.

After cooling, the calcined matter is removed to another apartment, where it is thrown into a series of tuhs, wherein the sulphate of silver is dissolved out of the oxides of copper and iron, by the use of water jets. The precipitation is effected in large tanks filled with fragments of copper plate. The product is then boiled with sulphuric acid in an apparatus pattented by Mr. Pearce for the separation of any traces of copper that may adhere to it. The precipitated silver is then taken to another room, where it is placed in drying pans, whence it is melted and converted into bars of pure metsl.

Thus far ouly the one metal above named has been obtained. The residues, containing a certain percentage of silver in combination with the gold and copper, are transferred to a room reserved for their use, there to await the crection of other apparatus especially designed for gold extraction.

The separating capacity of the present works is three tons of matte per pay. Mechanics are now engaged in enlarging it to the extent of six tons per day, so as to enable the company to meet all contingencies that may arise through the shipment of material from other mining countries, large receipts heing anticipated from the South Park, Salt Lake and tributary districts. They now have 150 tous on hand at the yard, as much more in Boston, sent there for shipment to Swansea, but which is to be returned here for treatment; a constant supply from their furnaces in the Mount Lincoln mines, the entire yields of the works on Clear creek under the management of Mr. Pearce, with the probability of that which is produced by the English company operating on Spanish Bar.

It may, therefore, be safely asserted upon the foregoing facts that within thirty days from this time Prof. Hill will send, through Wells, Fargo & Co's Express to New York, from twenty to thirty thonsand ounces of pure silver every wesk. When the machinery for gold extracting is added, sixty days hence, his shipments alone will be more than double the largest sggregates shown by our bullion records for the past ten years. By this last crowning addition to his facilities for the treatment of ores and matte, he has placed himself in a position to command extensive patronage from all the mineral regions of the trans-Missouri conntry, and hy his success in a field of enterpriss in which he has hut three contemporariss in Christendom, he has achieved ths imperishable prestigs of hsing the first to estsblish a new and importsnt industry in this Western Hemisphere.—*Colorado Register.*

County Aid to Mining Interests.

A correspondent of the Helena (Montsns) *Gazette* says: My attsntion has been attracted by ssvsral letters written from this city in regard to ths production of the mines in this and adjoining counties. The writer shows that there are in our nsighborhood over twelve minss that are now paying from ore that can be shipped east or worked at the smelter here sufficient to pay labor and grub, leaving on the dumps tons (he estimstes them at 1,000) of milling ors thst will not pay shipment and are not fit for smelting, but which sssay, on an average, over $50 per ton—running from $30 to $100. The question is asked how this large amount is to be released from the dumps, looking to the fact that until railroads reach us the capitalists from abroad vsnture not amongst us. Ths writer recommends the counties intsrested being authorized to loan their credit for this purpose. The suggestion is made that our county loan, say $100,000, and Madison, Deer Lodge and Bea-Head the same. I am inclined to think the plan feasible. Of course, the loan should he guarded as strongly as possible. It should be placed in the hands of commissioners who will look well to its investment.

There are, in many of our mining districts mills that could be easily arranged for the reduction of our silver ores, but the owners have not the capital to erect the furnaces, etc. From examination I feel well assured that if a mill and a Stedtefelt furnace were erected—one on Ten Mile and one at Jefferson city—this coming year, they would add such an impetus to mining operations that I can hardly estimate it. Such also would be the case in Madison county, if mills and furnaces were erected at Brown's gulch and Chery creek. In many cases a loan could be made to works already up and secured on them and the additional works to he erected, adding value to what is now an unused thing. From the fact that no railroad will reach us for years, a suggestion that promises to relieve a community that you may well call "Poor Montana," is of importance. And do yon not see in this an additional inducement for the capitalists to build the railroad? We talk of our mines—of their richness and their number—but they avail but little if we show no result; but let one of these works be estahlished in each county, and show as they undouhtedly would, favorable results, a new incentive would be given to a road being built. I am a miner and interested in that interest; bnt I think I know what I am writing about, and I do hope that this subsidising the miners will at least be discussed. Our wise men at the capital will know how, or should know how, to pass the bill.

Iowa Hill Canal.

For many years the divide lying between the North and Middle forks of the American river, has been, comparatively speaking, almost worthless for mining purposes, from the fact that there has been no adequate means provided to obtain a supply of water, an element equally as essential in mining as the precious metal itself. During the past twenty years numerous projects havo been commenced to supply this deficiency, hut have all failed; some from the lack of means to carry out so stupendous an undertaking, and others from the fact that the result would not be remunerative.

Last spring several of the hard-fisted miners in conjnnction with the husiness men of Iowa Hill, determined that the project of bringing in a supply of water from the head branches of the North Fork of the American river was feasible, and that they had waited long enough, Micawber like, for something to turn np. They accordingly formed themselves into a company, incorporated under the laws of this State, fixing their capital stock at one $1,000,000 divided into one thousand shares of $1,000 each. The present officers of the compauy being: J. W. Chinn, President; C. F. Macy, Secretary; and William Van Vactor, Superintendent. The Trustees are, W. H. Kinder, J. W. Chinn, William Van Vactor, D. W. Spear and C. F. Macy. On the first of June the company had three hundred men at work and have about completed all of the ditching from the head of Indian cañon to Tadpole cañon, a distance of twenty-five miles, and if fair weather continues for three or four weeks longer they will have completed all of the fluming on that portion of the canal. The last half mile, before reaching Tadpole cañon, will be by far the heaviest work on the route, the side of the cañon heing very precipitous, requiring a large amount of blasting to enable them to get a foundation for their flume.

The company have procured a portable steam saw mill, which is at present located at Secret Springs, and it is turning out about ten thousand feet of lumber per day. Men are now at work putting in the fiume, the principal portion of which will be at Pioneer gap and Tadpole cañon. The canal is seven feet on the bottom, nine on top, and four feet deep; the flumes are seven feet wide and four feet deep. The reservoir of the company is locsted on what is known as the Fish and Brown ranch, ahout five milss from Iows Hill, is said to he one of the finest pieces of work in the State. The embankment at ths hottom is one hundred aud fifty feet wide and is about forty on top at the prssent time. The towers in which the gate frame works are fifty-fivs fest high. The trunk snd gate were made at the Union foundry in San Frsncisco; the trunk is one hundred and fifty feet long and thirty inches in diametsr, and msde of No. 12 iron, heavily coatsd with asphaltum. The rss-ervoir as at present constructed, covers an area of sixty-five acres at an average dspth of twenty-two feet. Nsxt year the embankmsnt will bs raised teu feet higher, and it will then cover one hundred acres, at an average depth of tweuty-seven and one-half feet. The total amount of money expended up to the present time is ahout $60,000.

This is ths rssult of energy, perssrverance aud dstsrmination on ths part of a few resolute men, and we trust that thsy may bs snabled to meet with the liberal reward they hsve so well msrited and that their exsmple may he followed by others, so that ere long we msy he enabled to truthfully say that Placer county is second to none in the State, in the systematic and thorough devslopment of her mineral rssources. —*Placer Argus.*

Tallow-Cheese.

Since "dips" have gone out of fashion "good plain cooks" have been apprehensive of the fall of kitchen-stuff to so low a figure as not to be worth the trouble of "making." However, they need be under no misgivings. A Surrey gentleman has patented a process for making "cheese of rich quality" from skim-milk and tallow, provided the latter be not too highly flavored. The two are beaten into an emulsion, then treated with rennet in the usual way, and the outcome is fine Cheshire. The plan is not new, but this is the first time it has been made "patent" to the public. To our simple mind there seems some anomaly in granting this gentleman a patent, and denying one to the genius who some years ago made a machine for casting imitation coffee-berries from chicory, though it did not prevent the process being adopted. For our part, we prefer the genuine article under any circumstances; bnt we do not for an instant assert that tallow-cheese is not worthy to be placed alongside Battersea butter, kiln-dried bacon, lie tea, starch sugar, and the thousand and one factitious articles which now-a-days constitute an Englishman's *cuisine*. It is well know that the finer kiuds of foreign tallow never see a wick, and that a goodly proportion of it is burnt in children's stomschs under the omnigenous term of "dripping;" still the question remains whether the petty purveyor of "vulgar fractions" of cheese, under the name of "'arf-quart'ns," will be compelled to label the new compound as a "mixture," or, under cover of Her Majesty's Letters Patent, be able, like quacks, to baffle the law and defy the analyst.—*Iron.*

A Success.—The White Pine *News* says: We have mentioned the tailings mill, situated at Shermantown, in previous issues, and have been certain of its successful operation, but, with the racketty old machinery employed to run the pans, did not imagine it would hold out for so long a time as seems the case now. We are informed that the product of amalgam continues to be as large as ever and that an average of $300 per day is now the given proceed. This result alone is a matter of congratulation to the Eberhardt & Aurora company, who own the works and to whose enterprise and perserverance the county is indebted. Mr. Gumbinner is still in charge of the mill and deserves much praise for the manner in which he has conducted affairs since his assumption of the duties of Superintendent.

Rumored Sale.—We have heard rumors (and rumors are pretty close to news items these times) that parties are negotiating for the purchase of the Edgar mine, of the Ward Beecher Consolidated. We sincerely and earnestly trust there may be truth in this. Any change from the present selfish management of this property by which its destinies might be ruled hy other than the present parties, would be to the iuterest of all concerned. With the Edgar and some other claims on Treasure Hill consolidatsd, under energetic management, a marked change for the better would soon be apparent; as it now stands, the property will never benefit this community.—*White Pine News.*

The London *Lancet* reprehends the filthy custom of pasting one wall-paper over another till a thickness of an eighth of an inch or more is accumulated; it is too common, and is attended with the worst consequences. This was the cause of the puzzling offensive smell at Knightsbridge Barracks, London, that recently threatened the whole establishment with fever. The examination of the drains and taking up of the floors revealed nothing, while the introduction of increased means of ventilation left the evil as it was. At last an exsmination was made of the wall-papering, when it was found that one paper was pasted over another till a thickness was accumnlated amounting in one case to fourteen layers. Between these layers there was rotten paste, in which fungi and even maggots germinated; while the wall being hollow, the stench spread into the passage and over the establishment.

Robinson District.

Last wesk we noted the encouraging prospects which seemed to be opening up before this district. Since thst time we have had renewed assurances from rsidents as to the continued successful operation of the Watson company's mill, and most tangible proof of ths existence of the precious metal in bars of bright silver bullion, which have besn produced there during the last run. Nearly if not quits $600 per day has been the product of ten stsmps, and ths ore is being worked as high as 70 and 75 per cent. The energy and psrseverancs of Superintendent Elmore, under adverse circumstsnces, is a subject of general remark, and ths people of that whole section join in in his praise. We remember some noted miners and educated mill-men who said that the ores of Robinson district could not be trested successfully hy any known process, declaring the country a "bilk," which declaration they did not attempt to conceal from any one. It is certainly a victory over such wiss-acres, who are so confident in their own opinion to produce rssults from impossibilities. We suppose, if asked why the ores could not be worked, they would answer, as the school-boy does, "hecause they can't." Parties from Robinson inform us that everybody there is highly elated at the prospects before them, and those who have stuck to it through thick and thin, have only themselves to thank for persistency. Truly this instance is suggestive of what downright hard work and energy, assisted by a firm helief, will accomplish. During several years efforts have heen made to bring to a success the working of ores in this district. The Canton Mining Company purchased the Aultman and other mines, some time ago, and concluded the ores could best be treated by the smelting process, but, after several trials the attempt was abandoned, and they now contemplate building a mill. The successful operation of the Watson mill must induce others to invest in this district, and we predict for Mineral City an importance second to no other place in Eastern Nevada in a very short time. Not only are the silver-bearing properties numerous and rich but they show heyond a doubt the most essential worth of a mine, that of "going down." It is also a remarkable fact that ores whioh wsre hasc at the surface have changed their complexion to that of almost free milling ore at the distance of fifty and one hundred feet down. Then again the silver-producing rock is not the only intersst, in a mining sense. Immense bodies of high-grade copper ore exist all over the district, which have been developed in several instances to be of great value aud extent. The main and almost insurmountable difficulty has been heretofore the total absence of capital among the owners of copper claims, and their consequent inability to develop their mines, or to realize profit from the sale of ores. We trust, however, this drawback may be soon removed, and their extensive interest he made remunerative to all concerned.—*White Pine News.*

A New Steam Engine.—A small motor, suitable for sewing machines, has been invented by Frederick Siemens, in Dresden. It is described as a steam engine, which has neither cylinder, nor piston, nor guide bars, nor crank, nor valves, but only a boiler, which is at the same time the moving part. The machine works always with one and the same quantity of water. The steam passes through a cycle something like what is seen in nature; the aun evaporates water on the earth's surface; in the upper strata this again becomes liquid, and returning to the earth does a large amount of mechanical work. The machine is .01 horse power, needs little alteration, and is quite safe, the tension of the steam being low. If heated by gas, it consumes twenty-five cubic meters per hour. The cylinder-shaped boiler is expanded conically at the upper part. It stands at an angle of forty-five degrees, and turns on supports, while a beveled wheel arbor changes the motion into a horizontal or a vertical.

An electric apparatus has been devised which records music while the instrument to which it is attached is being played. The movement of the keys makes and breaks the connection, and the notes sounded are indicated hy indentations in paper, as in the eimple telegraphic recorder. The device will prove of service to composers.

The finest specimen of Brussels lace is so complicated as to require the labor of seven persons on one piece, and each operative is employed at distinct features of the work. The thread used is of exquisite fineness, which is spun in dark, underground rooms, where it is sufficiently moist to prevent the thread from separating. It is so delicate as scarcely to he seen, and the room is so arranged that all the light admitted shall fall upon the work. It is such material that renders the genuine Brussels ground so costly. On a piece of Valenciennes not two inches wide, from two to three hundred bohbins are sometimes used; and for a larger width as many as eight hundred on the same pillow.

New Hoisting Works.—The Woodville mining company have commencsd the erection of new hoisting works a short distance above the old works. The frame work of the building over the new shaft is already up and will shortly be enclosed.

SCIENTIFIC PROGRESS.

Vaseline; A New Product of Petroleum.

There acems to he no end to the uses to wbich petroleum is to be pnt, or at least for which it is to he tried, and the number of different forms in which it may be put or of substances to he extracted from it by the chemist, aeem also practically nnlimited.

The latest achievement of this sort is the production of a substance known as Vaseline, wbich seems snited to fill a vast number of requirements in both medicine and the arts. This article may be described as a refined and concentrated petroleum. It is of a bright amber color, and nearly free from odor, and of varying consistency, according to tho nees for which it is intended, as the manufactnrer can make it to remain fluid or to partially solidify at almost any given temperature. Its vaporizing or ovaporating point can also be changed, though it is usually put at 400° Fahrenheit. The method used in tbe manufactnre of this new candidate fer favor may be broadly stated as comprising the concentration of crude petroleum and the refiniug by filtration of the concentrated substance, no acids or alkalies being nsed in the process. This is an important point, as will be seen. The uses to which such an article as we have indicated may be put are almost innumerable, hut before enumerating them it may he well to glance at the nature of petroleum, the source of this prodnct.

Petreleum may be chemically described as a hydro-carbon, and as respects its position may be stated as between tha oils on the one hand and the alcohols and ethers, tha great solvents for oils, on the other. Its first and most obvious property is its resemblance to oil, and hence it is not at all remarkable that in the centuries during which it has been known it has been regarded as a natural oil. Not to go back to the ancients, it has heen knowu and sold iu this country for years nnder the various names of "Seneca Oil," "Rock Oil," "Indian Oil," and the like, and a heavy petroleum nnder the name of Barbadoes Tar has held a place in the ohsrmacopeia ver since there has been ona. As nas been said, the relation of petroleum to the ›ils is apparsnt enough, but its connection with the ethers is not at first as apparent. That t exists is, of course, apparent enough to the chemist, bnt it is not so apparent at the first glance to the ordinary observer.

Proofs of its existence, however, are common enough if not always noticed. Ite vapor, like that of ethers, chloroform, etc., is exceedingly volatile, and produces the same effect on the animal economy. Men have become dizzy from standing over vats of the crude oil, have tumbled in and were drowned; persons taking over-doses of kerosene, benzine, or the crude oil exhibit the symptoms of poisoning by chloreform. The medicinal virtues of petroleum depend on both these qualities, its oily quality making it a capital lnbricant, while to its analogy to the ethers is undoubtedly due the reputation which it really merits as a soother of pain. Heretofore the use of petroleum in medicine has been restricted by its odor, which is inteneely disegreeable to most persons, and which is not removed bnt rather intensified by the ordinary methods of refining. From what has been said, therefore, it will be seen that the uses of Vaseline, if its productien on a large scale of standard purity he kept up, will become very extansive. Having no affinity for oxygen or moisture, it ought to make an excellent preservative, and to be better as an application to burns, chafes, etc., than any other oils or glycerine. It should also, when sufficiently concentrated, make an excellent excipient in the preparation of cerates and unguents, and properly perfumed, could readily he made available on the toilet table. In short, any apothecary or physician will readily see the exceeding value of such an article. But this substance promises to be not less useful in the arts than in medicine. As it can be made, as has been stated, of any consistency, and eo as to be fluid at any given temperature, it promises to come extensively into use for the pnrpose of lubricating machinery. To use petroleum for this purpose has long been a favorite scheme with inventors and oil men, but there have always been obstacles in the way. The natural oil without being filtered contains too much impalpable grit to be adapted to fine machinery, and the refined as ordinarily made product has been found too thin, and is also injured by the acids and alkalies with which it is treated.—*Paint and Oil Trade.*

An improved method to produce hydrogen at a cheap rate has been proposed by Giffard. He passes steam over scrapa of red-hot iron; the iron decomposes the steam, is oxidised, and as the hydrogen escape through a cooled coil in which the undecomposed steam condenses. When no more gas comes out of the coil, he passes carbonic oxide gas over the red-hot iron. This at once robs the iron oxide formed by the steam of its oxygen, changing itself into carbonic acid. As soon as the amount escaping by the latter becomes small, the steam is again admitted. Giffard claims that in this way he can make 70 cubic feet of hydrogen per minute.

In the course of his experiments, M. Béamp found that he was able to detect an appreciable quantity of alcohol, as a physiological product of the liver.

Astronomical Notes.

In Italy a spectroscopic society has been formed, in order to unite several co-laborers to tha accomplishment of results unattainable by individual efforts. One of tho objects proposed to be executed first is observations on the sun from minute to minute, following the solar erruptions, in order to study all their phases; to draw day by day details of the photosphere, and arrange them on strips of paper; to represent and study the daily changes, whether great or small, going on in the spots and faculæ visible on the solar surface; every day making a spectroscopic chemical analysis of the chromosphere, and recording systematically the elements ejected by the continual erruptions; also to make frequent correct measurements of the diameter; and finally, to watch the perturbations of the compass-needle and the auroras, in order to determine how far they are under the immediate control of tha gigantic disturbances continually going on in the central globe of our planetary system.

In regard to tho nature of comets, which, according to the estimate of Arago, traverse our planetary system to tha number of 17,000,000, Zoellner thinks that they consist of nuclei too small to be separately distinguished, even by the strongest telescopes, and that the nuclei are surrounded by their own vapor of low tension, as we know that fluids such as water or mercury, and even nearly all kinds of solids, give off such vapers. If the mass of such nuclei be too small to manifest sufficient gravitation toward the common center of attraction, so as to condense the gaseous envelop, and cause a pressnre checking further evaporation, the whole mass is finally changed into a very rarified vapor, which the spectroscope has proved to be hydro-carbon, (petroleum!) Zoellner supposes this vaper to be hot, and charged with electricity, by the action of which the sun, which is also electric, attracts or rejects some portions of this vapor, and so causes the tails to be formed, which sometimes are repelled and sometimes attracted, and when the comet comes near enough, entirely absorbed by the sun. This appears the most rational theory on the nature of comets yet advanced, as it perfectly agrees with their behavior and the well-known properties of positive and negative electricity. That all the members of our planetary system mey be thus charged, is probable from the fact that the mess of our earth is always negatively electric, and as the planetary space ie so far a vacuum as to be a non-conductor of electricity, these cesmical bodies must retain their charges, it being practically proved that a real vacuum is utterly incapable of conducting electricity.

The large planet Jupiter is always drawing toward himself scores of comets and meteorites, which flutter arennd it always nearer and nearer, as moths toward a candle. They are continually increasing in size, and have done so perhaps for millions of years, at the same time retarding the cooling of this red-hot planet. So the latest observations and deductions have taught us.—*Manufacturer and Builder.*

The rings of Saturn have always heen an enigma to astronomers. La Place showed that if they were solid, and of the same thickness throughout, they would seon fall down on the planet and be destroyed. He therefore supposed them of irregular density. Not many years ago, Professer Pierce found that the same catastrophe would occur even in this case, and he and Bond have concluded that they are fluid. It soon became doubtful whether a fluid ring would be any more stable, and Professor Pierce hence conceived the idea that it was held up by the attraction of the satellites. Mr. Hirn, a French physicist, has lately presented a paper to the French Academy, in which he maintains that the ring is neither solid nor fluid, hut is a swarm of small particles, which looks solid owing to the great distance at which we see it. The idea is not new, as it was developed mathematically more than ten years ago by Mr. J. C. Maxwell, of England; but Mr. Hirn adduces some new arguments to its support. One of these is that when the ring is seeu on its dark side, which is presented to us on very rare occasions, it does not seem absolutely black, a little light shining through.

Purity of Water.—On the much vexed question of purity of surface waters, we are favored with a rather sweeping observation by Prof. Newberry, of the Columbia college School of Mines. He says: "There is much apprehenaion iu the public mind in regard to the purity of the water of streams which drain the surfaces of our own and other countries. Water in itself is a diainfectant, and a large volume of water, when exposed to the air, so rapidly 'fines' itself, by the oxidation of its organic impurities, that when cooled and settled or filtered to remove its suapended ingredients, the water of most of our streams is even more palatable and wholesome than that taken from wells." While tho Professor is undoubtedly right as regards the streams of the open country, hia remark does not apply to waters in thickly populated districts. Our own idea has ever been that thia very disinfecting property of water—that ia, its power of taking np impurities from the air and earth—is what makes it a vehicle for decomposing organic matter. In time, of course, thorough aeration and light have their influence.

Rusting.—Prof. Calvert says that pure, dry oxygen does not cause the oxidation or rusting of iron. Moist oxygen has only a feehle action. Dry or moist pure carbonic acid has no action, hnt oxygen containing traces of carbenic acid acts rapidly on iron, producing first a protoxide, then a carbonate of the same oxide, and lastly a mixture of protoxide and hydrated sesqnioxide. The phenomena of rusting are not well understood generally. Theories differ. In this connection we may again refer to the piano wire used in soundiug from the Tuscarora which, after long usege at all depths, was perfectly free from rust.

Varying Intensity of Solar Light.—It has long been believed by many that the light emitted by the sun is less intense near the edges of its disk than at the center. Vogel has devoted some time to actually measuring this difference, and finds that the light from the center is to the light from a point three-fourths of the soler radius from the center, as 48 to 35. How he obtained these figures, however, we are not told.

Mr. Cowie, of Shanghai, has observed the passage across the sun's disk of an object which he thinks is a planet nearer to the sun than Mercury. Prof. Kirkwood, by comparing Mr. Cowie's observations with other recorded dates of similar phenomena, concludes that they indicate the exietence of an interior planet, whose year is 34 days, 22 hours and 32 minutes.

The lima in calcareous waters is said to form an insoluble soap—or salt of the soap order—with the suint of wool, and this interferes with the effects the dyer wishes to produce. This is the case, especially, when fustic, madder or cochineal are used.

MECHANICAL PROGRESS.

Car-Coupling.

The *Railroad Gazette*, remarking upon the worthlessness of the great majority of car-coupling devices, and the lack of information on the part of inventors as to the practical requirements of the case, says:

It is, of course, poesible that some invention may be provided by which cars may be coupled without incurring any danger in doing it, but we believe that in this case much more can he immediately accomplished by improving the exieting forms and methods of construction than by attempting to introduce more sweeping reforms.

In a few minutes' conversation with almost any intelligent brakeman one can learn which kind of car is considered meet difficnlt end dangereus to couple. The reason for this opinion can also usually be traced ont. It will often be found, however, that while the opinions of such men are sonnd, the reasons they give for holding them are not. Their opinions and impressions are the result of observatione and the daily training which practice gives them, but their reasoning is often mere prejudiee. In other words, such men are experienced in the art of coupling cars, but very inexperienced in the use of the reasoning faculty. It is not, however, very difficult to discover with the aid of such the peculiarities in the construction of cars which makes them dangerous. As an example, let us take the construction of the ordinary wrought-iron draw-head. Usually the space allowed betweeu the buffer-beam or dead-wood and the coupling-pin is so little, that if the draw-head is forced back by contact with the adjoining car, the hand of the person attempting at the same time to draw the coupling-pin, will he, and often is, crushed between it and the dead-wood. Now, obviously the cure for this would be, either to allow more space between the pin and the car, or else put a stop of some kind to prevent the movement of the draw-head farther than a certain point, and thus allow room enough for a man's hand. It will also be found that on many cars blocks of wood or iron castings are placed in such positions that a man cannot reach the coupling-liuk or pin without aesuming a very constrained and awkward position, or exposing some portion of his body to the danger of crushing in case the collision of the cars is at all violent, as it often is. In other cars, there is too little room allowed between the platforms or buffer-beams for a man to stand when both draw-heads are compressed. In others, bolt-heads and sometimes the side-sills are allowed to project so that a man is liable to be caught between them, especially on sharp curves. We mention these only as examples of dangerous forms of construction. Our list is not intended to be at all complete, but only to indicate how, by getting the experience of the men who are exposed to these dangers, their cause may be discovered. Much information could also be gained, if on through lines, over which cars from other roads are run, a careful record were kept of such accidents and of the kind of cars which caused them.

Carefnl investigations of the accidents which now occur would, we believe, inevitably show that a large number of them are praventable by improved forms and methods of construction, and these improvements could be made without departing materially from the present way of building cars. If, however, any practicable invention will make it possible to couple cars without going between them, that invention will be the means of preventing an immense loss of life, and of saving incalculable suffering. What we want to make as clear as we can, is first, that cars of the ordinary method of construction can *certainly* be made safer, and that to make them so it is only necessary to exercise ordinary intelligent observation; and, second, that some invention *may* be practicable which will aliminate almost entirely the danger from coupling cars. At the last convention of the Master Car-Builders' Association, a committee was appointed to report upon this subject. If they do nothing more than collect statistics of the number of people injured from coupling cars, they will do a great service, as they will thus draw public attention to a subject that sadly needs it. They can, however, do much more than this; they can get tha results of the observation of most of the members of the association, who for years have had opportunities of learning the causes which make coupliug cars so dengerous.

Sbeuld the committee undertake to investigate the merits of inventions for coupliug cars, their task, we fear, will not he an enviable one. To say nothing of the magnitude of the undertaking, it would, we think, be a very serious matter to be ohliged to listen to all the patentees of such devices who would want to recommend their inventions. The respensibility of this committee is very great, as they have it in their power to stop in a measure the great waste of human life and limb which each year are sacrificed because so little effort is made to prevent it. Seldom is such an eppertnnity of being nseful to our fellow-creatures afforded to any of us.

The Rights of Inventors.

The New York *Graphic*, in alluding to an assertion now made, which, if true, deprives the late Elias Howe, Jr., of the honor of being the inventor of the sewing-machine, expresses some doubt as to whether a man is really antitled to a patent on an invention. The reasen advanced is that "as a rule a man's invention is not the invention of himself alene, but of other men who have preceded him, and whose work has inevitably led to the invention." Granting thie, we hold that the man who supplies the idea whereby a practical result is reached, ne matter how far the way toward that result may have been paved by circnmstances, or by the labors of others, has a right to his invention which is undeniable, and which ought to be protected. The electric telegraph for instance was not the iuvention of Benjamin Franklin. Yet Franklin demonstrated possibilities which, developed by other men, are availed of in the telegraph. The man who was firet to make a practical nse of electric currents for purposes of communication was the inventor of the electric telegraph, and to him was given the honor, and with it the profits of his invention, or adaptation, whichever peeple may choose to call it. Further still, every improvement any other man may make in the science of electrical communication is that other man's inventien, the result of his laher, his thonght, his investigation of existing poeeibilities, and of results already attained to. Deny a man's right in this respect, and at once the incentive is removed which leads to the inveutions and improvements which have become neeessities of the age.

When a mechanic, toiling at his hench day after day, perceives a possibility of improving the teol with which he is working, or of makiug a machine which will shorten the work he is doing, he sses before him the prospect of an improvement in his worldy position; and inspired by that prospect his energies are aroused and his acuteness quickened for the followiug out of the hint which has dawned npon him. Why sheuld he employ his leisure memeuts, exert his skill and expend his little savings in the perfection of an invention in which he will have no salable right, and which will not help him teward a competence any faster than his pledding day-work or piece-work helps him now? He is one of a class of men who in benefitting themselves benefit others; and so far as the law in regard to patents protects him in his claim to a mercantable right in ideas which he has applied in the invention or improvement of any article which is useful to his fellow-men, just so far as that law is equitable, wise, and in a measnre, the protector of general intereets.—*Boston Journal.*

Regulator for Car Lubricators.—M. L. Becker, constructor at Offenbach, has introduced a regulator for car lubricators in which oil is used, allowing the latter to act in the usual way when the train is in motion, but stopping the supply of oil with the stoppage of the train. The regnlator consists of an elliptical vessel, funnel-shaped, which is fixed by means of a screw on the top of the oil-box, and within it is a small ball which when the train ia not in motion falls to the bottom, closes the orifice there againat the air, and arresta the flow of oil; when the train begins to move, the ball rotates aronnd the hole, which is thus left free. Six months' trial have proved that the ball acts with perfect regularity, and that heing always greasy it does not show any perceptible wear. The effect wns shown by placing one of these regulators on one side of a locomotive, and it was found that the conaumption of oil waa 35 per cent. less than at the other end of the same axle, not ao provided. The new regulator does not interfere with the replenishing of the box, but with the oil chamber may be made large enough to require filling only once a day; it also keeps the wick and oil remarkably clean. These little appliances cost from 23 to 33¾ francs per dozen.

Our Weekly Stock Review.

THURSDAY EVE, Dec. 4, 1873.

Stocks have been pretty lively during the past week and a good business has been done at rising figures. Best & Belcher has been making quite a stir this week. The supposed reason for this is based upon indications found in the drift running from the 1,165-foot level of Gould & Curry through Best & Belcher gronnd into Consolidated Virginia. It is reported that the ledge developed in the Consolidated Virginia, like all the ore bodies of the Comstock, is pitching south, and hids fair to make a fine mine of the Best & Belcher. There have been rumors on the street for several days to the effect that those in control of the Consolidated Virginia were quietly buying up the stock of their neighbor, and for that purpose were keeping the drift on the 1,500-foot level closed to outsiders.

The suit of the Raymond & Ely vs. Kentucky has been decided against the latter, the Kentucky having failed to prove the identity of their location with the Raymond & Ely lode. Over $5,000,000 was involved in this suit. The Raymond & Ely shipped on the 29th $23,221 making a total of $114,370 that far in November.

The Chollar Potosi mine last week sent to the mill 754 tons of ore assayiug $30.40 per ton.

The report of the Superintendent of the Enreka, Grass Valley, for the week ending Nov. 29 says: "Onr cleau up for the last six days' run of 15 stamps is 1,300 ounces of amalgam. The bottom east drift is in 500 feet from main shaft; the ledge is 20 inches wide and regular, but looks poor. The gronud in the shaft is hard, which makes slow sinking. The ledge in the stopes is split up in places, but the quartz is of fair quality. No change in other portions of the mine."

The Golden Chariot (Idaho) shipped $11,945 on the 24th, the product of the mine for one week.

The Chariot (San Diego county) mine, a new corporation, received $5,120 this week. They propose paying dividends in January.

The Belcher mine will turn out $1,000,000 this month.

The Monitor-Belmont mine has announced a dividend this month of 50 cents per share, aggregatiug $25,000. This is the third dividend of the company, the other two having been paid in February and March.

Dividends last month were as follows: Belcher, $4 per share, $416,000; Black Bear Quartz, 20 cents, $6,000; Consolidated Amador, 50 cents, $15,000; Crown Point, $3 per share, $300,000; Derby, 50 cents per share, $15,000; Enreka (Grass Valley), $1 per share, $20,000. As compared with the same month last year, the mines turned ont in 1873 the sum of $772,000, and in 1872 it was only $225,100, while in 1870, the sum of $294,000 was paid. Last year the Raymond & Ely paid $210,000; Cederherg, $12,000 and Providence $3,100.

The production of hullion in the Washoe mines continues very large, and does much to commend mining operations. The proceeds of the mines of Storey county for the quarter ending September 30th, were as follows:

NAME OF OWNER.	Tons Extr'd	Gross Yield	Net Yield	Amount Tax.
Belcher	34,044	$2,252,219 73	$1,341,718 38	$20,125 78
Crown Point	30,092	1,762,735 33	1,057,214 98	14,358 22
Chollar Potosi	8,821	154,553 63	30,913 13	463 70
Caledonia	4,559	63,826 00	12,765 20	191 47
Empire	3,300	30,800 00	3,080 00	46 20
Gould & Curry	2,955	35,216 96	3,521 70	52 82
Imperial	424	5,342 23	3,054 34	45 81
Justice	1,450	16,384 00	1,638 40	24 58
Occidental	1,478	10,752 31	1,075 22	16 13
Silver Hill	5,175	42,555 75	4,255 57	63 84
Sierra Nevada	5,454	42,086 05	4,208 60	63 13

Hale & Norcross	6,104	115,546 97	23,509 39	352 64
TAILINGS.				
Parker & Bowie	11,300	80,264 87	8,024 49	120 40
O. C. Stevenson	350	2,100 00	1,750 00	26 25
Union M. & M Co	5,700	4,375 00	2,137 50	32 06
	121,206	$4,616,650 16	$2,389,163 74	$35,987 45

NEW INCORPORATION.—The White Mountain Mining Company filed its certificate of incorporation in the County Clerk's office, on the 3d inst. The location of works is in Lower Rancheria, Cal. Trustees—Wm. T. Henson, C. J. Pilsbury, Isador Charles, D. M. Hosmer and Gustave Meyer.

THE YAKIMA MINES.—Reports from these mines lately received, are not so encouraging as those first sent down. The *Spirit of the West* says: The stampeders who rushed from this section to the Yakima when the gold discovery was first roported, are returning almost as fast as they went. Their opinious confirm our assertions made last week, that there is gold there, but not in paying quantities.

RICH GOLN discoveries are reported in the new mineral district known as Gold Hill, some ten miles from Boulder, Colorado. The veins are unusually wide, and show plenty of free gold.

THE Raymond & Ely mining company has wou its suit against the Kentucky, the decision having been given at Pioche this week.

THE Spring Valley Canal & Mining Co. have sent another large gold orick to this city, worth $65,000.

COAL of good quality has been found at the head of Tres Pinos, Santa Clara county.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

MINING MATTERS.—Alpine *Chronicle*, Nov. 29: The mines are in much the same condition in this immediate vicinity as they were one week ago. At the M. & N. Co.'s mill, preparations are going on for some changes so as to adapt the mill to wet crushing and raw amalgamation. Lumber for tanks is being delivered there, and other evidences of activity are noticeable. In the Silver Glance work goes steadily on, and indications, both in the shaft and deeper levels, as well as in the west drift, continue very flattering. Mr. Hunter of the Schenectady has finished crushing, but had not at this writing commenced to clean up. He has some good looking amalgam and abont 176 ounces of bullion that indic

as the plan of operations has been heretofore, however, we learn that work is to be conducted upon a scale of greater magnitude than ever during the coming winter. New mines are to be opened and facilities provided for working to better advantage and greater effect. The water—of which twelve hundred inches will be used—is to be conducted to the claims in three iron pipes, the largest being twenty inches in diameter. Some idea of the enormous force of the hydraulic can be obtained when it is understood that the water has a pressure of between two and three hundred feet. Seven streams will be thrown, an admirable system of converging ground sluices conducting the water and gravel into a main flume. Everything is in readiness for the commencement of washing, and as soon as the rains set in work will be continued day and night.

Wolverine.—The damages to the machinery of the Wolverine mine have been repaired and work resumed. We understand that no more labor will be expended in the levels until the sinking of the shaft to a depth of 500 ft. is concluded.

Chispa.—Mr. Schlaud of our town showed us a nugget of gold, one day this week, that weighs $116. The strangest thing about it is that the *chispa* was picked up on the surface of the ground. It was found by a Chileno while hunting quail.

Railroad Flat District.—The wonderful strike in the Sanderson mine not only continues but is gaining rapidly in bulk. The face of the south level shows no decrease in size of ore or richness. In the south level alone, which is now 50 ft. in length, the most magnificent body of ore ever seen lies uncovered. The ore, taken in bulk, is certainly the most valuable in free gold ever brought to light. But average samples of sulphurets, after carefully separating the free gold, assay over $900 per ton. A raise which is being run up in the south level yields masses of sulphurets which are not alone of immense quantitative value, but also attract attention by their peculiar beauty. The depth of this body, above the 200-ft. levels, is nearly 100 ft. Longitudinal extent not ascertained as yet. The Prussian Hill is developing finely under the able management of its Superintendent, Mr. Macnevin.

EL DORADO COUNTY.

New Ditch.—El Dorado *Republican*, Nov 29: Work upon the new ditch is progressing rapidly, and we understand that at least 150 to 200 hands will be kept at work all winter, and that early in the spring 500 hands will be employed, and that by another fall the work on the entire line will be completed. The work done this winter will ensure a greatly increased supply of water for next season, so that everything in that direction looks hopeful.

FRESNO COUNTY.

Copper.—*Expositor*, Nov. 29: Notwithstanding the tight condition of the money market the Ne Plus Ultra Copper Mining Company are enabled to sell their ores at a fair figure. With all the disadvantages of working, and the great costs of freight, the mine pays more than expenses.

INYO COUNTY.

Piute District.—For some months prospecting has been steadily going on on several of the locations in Pinte district, situated in the mountains opposite Old Owensville, notably the Luello, Buena Vista and Golden Era. Samples of the ore just taken out leave no question as to the richness of the mines. The mines are grouped in a series of gold and silver veins, the lumped assays of which range from $230 to $686 per ton. The gold ledges show ore carrying sulphurets and iron pyrites, said to be as easily reduced in arastras as the Fish Spring rock, by a process somewhat peculiar to that locality. The silver rock is a study, containing the metal in a half dozen native states, with frequent colors of gold visible.

KERN COUNTY.

Bright Star Mine.—*Miner*, Nov. 29: From Mr. H. Bahten we learn that they are now working on a ledge at the lower level that pays big. The mine is now in an almost perfect condition. Levels, drifts and cross-cuts have prospected the mine so well, that the owners consider it worth $25,000 more this year than last. Ten more stamps will soon be added to the mill.

Limestone Ledge.—W. J. Grant, of South Fork, has discovered a rich limestone ledge. It is about 16 miles from Havilah, and has an average width of forty feet. Col. Strong has tried a ton of it, and the workmen represent it as being first rate. Mr. Grant has burnt considerable of the stone and has a large quantity for sale.

MARIPOSA COUNTY.

Rumored Sale.—Mariposa *Gazette*, Nov. 28: Negotiations are on foot for the sale of that valuable and celebrated property situated at Hite's Cove, and known as the Hite mine. The reported purchasers are represented to be an English company with an immense amount of cash. It is one of the richest mines in the State of California.

NEVADA COUNTY.

New York Hill.—Grass Valley *Union*, Nov. 26: This mine has been working successfully for many months past. A good test is now about to be made of the value of the ore. Yesterday the mine began to send quartz to Perrin's mill to be crushed, and in a few days we shall know what the ore yields by mill process.

John Schmidt's quartz ledge, Nevada City, appears to be very rich. It is yielding $200 quartz.

The stamps of the Orleans mill began a few days ago to drop on ore from the Magenta mine.

Magenta Mine.—Nov. 27: The west drift of the Magenta mine took another big start yesterday, and yielded rock and dirt which gave at the rate of $200 to the pan. The crushing at the Orleans mill is progressing satisfactorily and the amalgamators show that a good clean up will be made. The Magenta will be able, if the trustees so will it, to make a handsome dividend ont of the first crushing.

PLACER COUNTY.

Rising Sun Mine.—Grass Valley *Union*, Nov. 27: The Rising Sun is proving to be a good little mine. Its clear profits last month were about $6,000, and about the same will be cleared this month. The mine is working at the depth 400 ft., and developments are being made for another level.

SIERRA COUNTY.

Bonden. — *Messenger*, Nov. 22 : The Bald Mountain Gravel claim, at Forest City, has been bonded for $450,000, the present owners to retain possession until the first of next April, in case of sale.

Gold In Sierra Valley Wells.—On Saturday last an old '49er, George Hyde, while digging a well on a ranch adjoining the residence of Aaron Davis, brought up some gravel which proved upon washing to contain gold in such quantities as to cause quite an excitement, and the staking ont of claims all about the vicinity.

TUOLUMNE COUNTY.

What a Quartz Mill will do for a Town.—*Independent*, Nov. 29: As an example of the benefit resulting to a community by the development of a good quartz mine, we may instance the Golden Gate which has been opened the past year, and with a fine ten-stamp mill is waiting for water to yield up its golden wealth. The sum of $20,000 has been paid by the company, thus far, in improvements, labor and other expenses, all in Sonora, and coming from outside the county. When the water comes, the mine will give employment to a large force, and a great portion of the yield will necessarily be expended here, benefiting directly or indirectly every branch of business. When our numerous quartz veins are properly opened and intelligently wrought for the gold they contain—and not for speculative purposes—our county will prove to be one of the most prosperous in the State, and our farmers find a home market for all they can produce.

Work is progressing rapidly in the south shaft of the Soulsby mine, and the miners will be getting out ore tho latter part of the coming week. The damage by the late fire was not so great as at first supposed.

Items.—The workmen in Spring Gulch mine have struck a rich chute of ore about 18 inches in width, which will pay about $500 per ton. The Chaparral quartz vein is three feet in width, and shows gold all through the vein. In the tunnel, 150 ft. from the surface is the rock, and will probably pay about $50 per ton. The ten stamp mill on the Buchanan mine will start up in a few days. Superintendent Tulloch has 200 tons of rock on the dump which is supposed to pay from $20 to $30 per ton. The lead at a depth of 175 feet is ten feet wide and gold can be seen from one side to the other, and rock enough in sight to keep a 20 stamp mill running for twelve months.

Nevada.

WASHOE DISTRICT.

Consolidated Virginia.—Gold Hill *News*, Nov. 29: There is no particular change to report in the different ore-breasts and stopes. The ore-breasts are yielding the regular daily supply of ore of good quality. The winzes are still advancing downward in ore of similar character to that heretofore described. The south drift, on the 1,000-foot level, is carried forward in ground of a very favorable nature. Sinking the main shaft is making rapid progress, the ground penetrated being easily excavated. The various prospecting operations in the different sections of the mine are carried on with unrelaxed energy.

Crown Point.—Daily yield of ore, 400 tons. Connection has been made with middle winze on the 1,400-foot level, thereby securing excellent ventilation. The 1,400-foot level has been entirely freed from water, and is now dry as a powder house. The work of draining the 1,500-foot level is being prosecuted vigorously, though, owing to the large flow of water, the pumps are taxed to their full capacity.

Europa.—Some very good ore prospects were obtained from this mine, in its early workings, and now, after a long season of rest, it is being reopened and worked with a view to practical development.

Argent.—A few weeks since work was resumed under the superintendence of Mr. E. E. Rice, of San Francisco. The old shaft has been cleaned out and repaired to the depth of 77 ft., and it is the intention to commence the extraction of ore as soon as the level is reached from which the ore was extracted in early times.

Caledonia —No ore is being extracted for the present. It will take nearly a week yet to complete the work so as to be able to resume work in shaft and mine. A drain tunnel has been started 10 ft. lower down than the old Caledonia tunnel. It will tap the shaft at a depth of 225 feet from the surface, and will be, when completed, 1,025 ft. in length.

Baltimore Consolidated.—Sinking the shaft is making rapid progress, the ground in the bottom working finely. It is now down 83 ft. below the third station. There is still a steady improvement in the quality of the ore at the first station. Nothing else new to report.

Justice.—Daily yield 55 tons of ore. The main north drift on the 400-ft. level is still driven ahead. The west cross-cut from this drift, 200 ft. north of the shaft, is daily expected to cut the ledge. The winze in the main south drift on the 400-ft. level is making good progress downward, the prospects of good ore developments in this portion of the mine being steadily on the increase. The raise from the north drift on the 300-ft. level is making excellent progress and will soon connect with the level above.

Ophir.—The prospecting drifts on the 1,300-ft. level have developed no change of importance during the week. The main south drift on the 1,700-ft. level has shown considerable improvement.

Hale & Norcross.—The drifts being run on the lower levels are still advancing through the same character of rock as we have heretofore described. Sinking the incline continues uninterruptedly, good progress being made. The ground passed through by the incline continues of a soft character.

Gould & Curry.—The prospecting drifts on the 1,500, 1,600 and 1,700-ft. levels are driven ahead with the usual rapid progress. There is to change to note in any of the workings on the 1,600-ft. level. The east drift on the 1,500-ft. level is now in softer ground, undoubtedly a species of vein matter. From this drift a considerable volume of water of a high temperature is flowing.

Sierra Nevada.—Quite a force of men has been employed during the week in blasting off and leveling the surface of the ground for the new hoisting works. Sinking the new shaft has been commenced and is making good progress. The erection of temporary hoisting works for the winter will soon be completed.

Julia.—The water in the shaft has been reduced to within 24 feet of the 1,000-ft. station. The main southwest drift, at the 900-foot station, is pushed vigorously ahead, the indications in the face being excellent for good ore developments soon. The west cross-cut from this drift is expected to cut the ledge in a very short time.

Arizona, Utah and Globe.—The cross-cuts south from the bottom of the incline are still in fine looking quartz, which gives assays of $5 to $10 per ton. The main west drift at the 400-foot level is still pushed vigorously ahead, the face in porphyry with occasional streaks and stringers of quartz.

Challar-Potosi.—Daily yield, 160 tons of ore, the assay value of which is $33 per ton. The progress of the main southwest drift at the third station has been considerably retarded by the swelling nature of the ground passed through, making repairs to timbers and drift almost continually necessary.

American Flat.—The quality of the ore found in the main southwest drift at the third station shows a decided improvement during the week.

Jacob Little.—Driving the main tunnel as usual, with no change of value to report.

Overman.—Prospecting on the 1,000 ft. level is still prosecuted with vigor, and no changes of interest to report. The main west drift on the 1,200 ft. level is making fine headway, the rock in the face working finely.

Belcher.—Daily yield, 500 tons of ore, principally from the 1,000, 1,200 and 1,300 ft. levels. The main incline is down 184 ft. below the 1,300 ft. level. The drift on the same level running southward from the Crown Point line is in 490 feet, still in ore. The winze from the 1,200 ft. level is down 111 ft.

Savage.—Sinking the main incline is making better progress, the rock in the bottom working much softer. The east cross-cut from the main north drift near the Gould & Curry line is still driven to the eastward without change of interest to note.

New York Consolidated.—The connections between the new boilers and the engines are completed. The old pump has been taken out and the new one is being put in.

Sutro.—The main west drift is in 120 ft., the indications of good developments of ore being excellent, whenever cross-cutting the ledge shall have been commenced.

Silver Hill.—Owing to the striking of a heavy flow of water in the main south drift, at the second station, work in the shaft has been suspended for a greater part of the week. Prospecting in the north drift, at the second station, is still proving more conclusively the great extent and value of the ore deposits already developed.

Succor.—The east on the line of the ledge from the small shaft in the cañon, east of the mill, is still driven vigorously ahead, following the ore vein, which is about 6 ft. in width of fine ore.

Yellow Jacket.—The company are cross-cutting on the 1,400 and 1,500-foot levels; also sinking the main incline, which is now down 40 feet below the 1500-foot level.

Alpha.—The north drift from the 1700-foot level is still pushed steadily ahead following the west wall of the ledge, without change of interest during the week.

Daney.—Sinking the shaft is making the same rapid progress. The machinery is working to perfection.

Arizona.

Mining Items. — Arizona *Miner*, Nov. 18: Willard Rice was at Head & Co.'s one day last week, with about $300, the proceeds of six tons of Cornucopia ore, just crushed in his arastra at Bowers' ranch.

The arastras on Kirkland Creek are running on Rainbow ore. Mr. McAteer informs us that a big run on rich Vesuvius ore will shortly be made.

Mr. Ballou, of Lynx creek, reports quartz and placer miners doing well over there.

Mr. Goodwin brought in several ounces of gold from Bradshaw district, this week.

Bill Smith's mill, near Wickenburg, is crushing between 110 and 115 tons of ore, every week. The mill is paying well.

Colorado.

Lake District—*People*, Nov. 22: Silver Star Lode, 4 ft. thick, assays from 76 to 150 ounces to the ton; Mammoth Lode, 7 ft. thick, assays from 120 to 136 ounces to the ton; Champion Lode, 3 ft. 4 inches thick, assays from 16 to 100 ounces to ton; Major Lode, 4 ft. thick, assays from 60 to 2,100.

The Major Lode contains also a streak of gray copper, 4 to 15 inches thick, running through its center.

Animas District.—Green Mountain Silver Lode, 1 ft. thick, assays from 200 to 1,300 ounces to the ton; Little Giant Gold Lode, 1 ft. thick, assays from $125 to $4,000 to the ton; Shenandoah Silver Lode, 8 ft. thick, assays from 60 to 220 ounces to the ton—the Shenandoah yielding also from $16 to $175 in gold to the ton of ore.

Should any one be surprised at this statement, as many undoubtedly will be, or should any person be inclined to doubt its accuracy, we simply say that we state the facts as they were given us by Mr. B. F. Newgent, of this place, and just returned from Del Norte.

Idaho.

The Rescue Mine.—Mr. A. Leland in a letter to the Lewiston *Signal* says the hoisting works' for the Rescue mine have been shipped from San Francisco, and a portion of the machinery is on the road from Wallula, but thinks it will be too late to pack the machinery in to the mine this fall, in consequence of the blocking up of the trails with snow.

Banner.—*Avalanche*, Nov. 15: Messrs. J. F. Hill and Jesse R. Bradford, after two weeks' run on the claim on the south side of Mooro creek, near Idaho city, cleaned up the boxes a few days ago and took out about $3,000. Ore from the Banner mine is literally filled with silver. Ores from the mines at Silver city are now being sent to Winnemucca for working.

Boise County.—Idaho *World*, Nov. 6: Mr. P. B. Laraway, an old pioneer of the Basin, returned from Loon creek a few days ago. He reports mining operations in no way prosperous in that section, and says that only about twelve white men will winter in that camp, although quite a number of Chinamen will remain there.

Mr. Jacob Phillip has completed the removal of the machinery for Plowman's quartz mill to the site selected in Illinois gulch, and work has commenced excavating for a site for the mill.

Mr. M. Hutchinson, who is a member of the company that recently purchased the sulphurets of the Gold Hill mill, informs us that their machinery, now on the road from Winnemucca, would arrive in about two weeks, when no time would be lost in putting it in place to commence operations as soon as possible.

Montana.

CLANCY DISTRICT.

Legal Tender. —*Gazette*, Nov. 19: They have only 26 feet to go to finish their great tunnel of 784 feet. When the connection is made it will be the best developed mine in the Territory. They are taking out more high-grade ore at the present time than ever before.

The Porter Bros.' mill at Lewiston continues to keep pounding away. It is now running on ores from the Rumley, Calumet, Legal Tender and Mammoth mines, all of which give satisfactory results.

Drifts are being run on the Mammoth mine both east and west from the main shaft, and ore is being taken out for the Porter mill at Lewiston. The vein looks well and the ore is of high grade.

The Saint Patrick lode is being well developed by I. I. Lewis, of Legal Tender fame, and Capt. Turner. They have lately erected a fine hoarding house, blacksmith shop and whim house, and are now timbering the main shaft in a first-class manner. The ore taken out is of high grade; the vein is twelve inches, and the crevice 2½ feet.

Utah.

LITTLE COTTONWOOD DISTRICT.

Shipments.—Salt Lake *Tribune*, Nov. 26: The shipments during the week were not as large as last week, on account of teams being unable during the snow storm to reach the mines from which they were hauling the ore. The Emma shipped about 80 tons, the Flagstaff 400 tons, the Grizzly 100 tons, the Davenport about 50 tons, and the Vallejo 50 tons.

The Emma's shipments have not been quite as large as the week before, on account of a new pump being put in the mine, which prevented the raising of the usual amount of ore out of the mine. The foundation for the new boiler is being laid and will be finished some time next week. It is placed alongside the old one for the purpose of getting the water out of the mine a little easier than was done last spring.

The Davenport mine is looking well and improving daily. A vein of rich ore was struck yesterday, with every indication of striking a large and extensive body of ore in a day or two. This mine seems to develop itself as a valuable piece of property, and will continue to rank among the leading mines of our district.

The Flagstaff continues to work, and is said to be looking well.

Egan Canon, Cherry Creek, Ruby Hill and Robinson.

A corrsspondent of the Wbite Pine *News* writes of the abovs msntioned districts as follows: Work has been recommsnced on ths property of ths San José Mining and Milling Company at this place. Ths Superintendent, Mr. Leach, was engaged in placing two pumps in position to dry out the Gilligan mine, which is ths principal mine of the company. Tbis mine had hsen sunk to a depth of nearly 600 fset, soms eighteen months past, when owing to ths inadequacy of ths pump then in uss, and an unusual flow of water, the work had to bs discontinued, to await increased pump capacity. The work now in progress was heing done nnder ths immediate supervision of the managing director of the company, M. J. O'Connor, of San Francisco, assisted by Gensral Rosencrans, as consulting and advising engineer. These gentlemen have coms to Egan determined to pump the oncs famous Gilligan mine dry, and see for themselves what prospscts and promise of a paying mine are to be fonnd in the loweet developmsnts thereof.

There ie no doubt, but what, nndsr ths management of these gentlsmsn, with ths remarkably fins prospects, not to say the grand resulte, which ths Gilligan hae at all times given, and yisided thrnugh ths little 5-stamp mill in days of yore, it will soon again hs contrihuting very largely to the bullion products of Eastern Nevada. Arrangements are being made to have the 20-stamp mill at this place started up on or about December 15th next, on orss from the mines of Cherry Cresk district.

The 5-etamp mill at the Rye Patch company, at the month of Egan oañon, ie running constantly on ore from the Exchequer mine, Chsrry Cresk, which the company purchased in August last. The gross yield psr day was $1,000.

Cherry Creek.

Ths general outlook of this camp is good. The prospects are sxtensive, so far as surface indications go, aud a very large amcunt of money is evidently in view. The development of the district is indeed insignificant, and affords no opportuuity of forming any opinion as to psrmanence or continnity. Judging from surface indications the pay mstal will be found in bonanzas, or chimneys, at intervals along the courss of two very extensive quartzite helts which run northeast aud southwest across the sast facs of the mountains, accompanying which, on ite upper undsrlay, ths precious metals of silvsr and gold are found in regular quartz gangus. Outside thsss two zones or belts of quartzite, no appreciable amount of pay metal has thns far hsen found. The sxtent of them, linsally, is about sight miles, and their dip westerly, or into ths mountain. Ths minss so far opened, and from which several lots of high grads ore have been extraoted, much of which has been sent to Eurska for reduction, ars the Gensva, Teacup, Wanderer, Pine Nut, Gray Eagls, Bsttie, Chance, Victoria, Flagstaff, Star and Silver Glance. The ores of these minee, as samplsd in the large way and not from specimens, give iu silver from $100 to $480 per ton, and in gold, from traces, to $20 psr ton.

Ths orss of the district are of the stromeyerite, or silver copper glance class, and are susceptible of heing rcduced to at least 75 per osnt. hy the uuroasted procese or free amalgamation, but should be crushed dry, for reaeone wsll known to all practical mill men. I am of the opinion that 80 psr cent. of tbess ores can he obtained by raw working. There is already quite a lively little town built np on the crsek from which the district and towu ars named, distant from the mines four or six miles. Thors is a good lodgiug houre or two, storss and restaurants, with a few ealoons, not more, I think than a dozen, and an A 1 livery stable, kspt hy Martin & McPbsrson, where visitors can be accommodated with all manner of conveyancee, whether to visit ths mines, or take a drive for pleasure to the hot springs adjacent.

Ruby Hill.

I paid a business vieit to this place, and found that certain of the minee were indeed possessed of merit. After making examination of such ae it wae my duty to investigate, the first thing that struck ms was the fact of thess minee lying idle. Here I found prospects, which if situated in any of the innumerable districte it has been my lot to pass through, would he in the hande of msn more inclined to work than to litigate such valuable propsrty. On inquiry, I found ths company were at loggerhsads and in law with the vendor, while the poor men who worked for them in the mines were still unpaid, and many others, who rendered ssrvices of various kinds, had sued and attached the property; yet "chloridere" were digging out the ore, hauling it to Eureka, a distance of some 130 miles, and when they got their samples assayed and settlemente made at the Richmond works, found the ore had gone from $900 to $1,500 per ton. Had the prospect I speak of heen limited, and hut little ore in sight, I should not have notic ed it thue, but I must say it ia very extensive, and showe a largs amount of money in sight. It is only one mors of the many really good prospects of the country frittered away by bad managemsnt.

Robinson District.

As my stay was hut hrief, so shall my notes be also, for the pressnt, intsnding, as I do, to do this camp justics, by a more thorough study of its prospects, which on first sight, havs very much excited me, from the immense amount of ore to he met with on every side, as one traverses the mineral belt of this wonderful district. I, however, in the course of my travels, accompanied hy Messrs. Cranley, Cahill and Gleason, during a tour of six hours' duration, had an ampls opportunity of forming some opinion of the district. After visiting ths Hayes mine, as well under as over ground, the Kate Hayes, Hicks, Cliff, Badlam, Georgs Lamb, Emmet and Norfolk mines, I had a pretty good opportnnity to form a general opinion of the prevailing characteristics of the camp. The general outlook of these properties, with the result of the samples I had taken and tested from all the mines vieited, gives sufficient assurance of ths merits of Robinson District, to enable me to say tbat it will do to stick to if properly handled. The ores, I find to he in value of precious mstals, from $45 to $75 psr ton, giving an averags of $60; this applies to a certain grade of ore, of which there ars tens of thousands of tons, and, which, liks the ores of the grsat Comstock, must he treated in large mills, aud at ths minimum cost of rsduction; but, unlike the Comstock, the ores of Robinson must he crnshed dry instead of wet, a differencs I will yet explain. Let friend Elmore crush dry, increase his stamps from ten to twenty, or forty, and Rohinson is all right. Ths real good smelting ores of Rohinson are few, and smelting, sxcept to a limited extent, muet ever he a failure there. But lst ms say, or rather euggest, that I think ths Maker of ths Univsrse placed all those silvsr and gold bearing iron ores in Robinson, eimply to have them hauled to White Pine as a flux for the refractory ores of the latter district, which ars without limit thsre. Samples of gold and silver bearing ore from Rohinson, with $45 to $80 psr ton of these metals, gave me from 35 to 50 per csnt. of oxide of iron. This is the identical flux your unbounded resourcee of White Pine hase metal orss in silicioue gangue, require to flux them; gét a proper and profitable ssparation of the bass and precious metals, and make White Pine what it should hs, what it will bs when taken upon thie basis. Bring Robinson iron ore of 40 per cent, and $40 gold and silver, per ton, to Wbite Pine, and mix one ton to two of your base ores, aud thsy will emelt like metallic lead. Tbs grsat want of White Pine has been the deficiency of iron in ths hass orss, whils the grsat euccess of Enreka has been in the sxcsss of iron contained in her lead oree propsr.

A Valuable Invention.

Ths Boston calamity has bronght into prominence an invsntion which has been tried with great succsss in Chicago. It consiets of an iron shaft, extsnding sither over a single window, or the entire length of the huilding and on all eides, as may he desired, and eecreted in the cornice, entirely hiddsn from view. Upon ths shaft are coiled flexible wire rope ladders, of sufficient length to reach the gronnd. Iu this drum, upon which the ladders are coiled, is a sheave, through which passes a single wire rope, with hooks at each end, which unfolds with the ladder, hoth ends reaching tbs ground. To operate thie machinery, a box similar to the fire alarm boxes is placed in any part of the buildiug on tho outside, where a policeman can have access (fire alarm box keys fitting their hoxes), or in the offics of a hotel. When an alarm of fire is given, the hox is opened and the lever presenting itself is pulled. This releases the break that holds the shaft, and tbs ladders descend slowly in front of every window in that house; so that in cass of fire tbs occupant of a room in the eighth story of a building may step from his window on to the ladder, with his back to the wall, and dsscsnd in safety to ths ground. The fire department arrives upon the ground; ons end of the wire rops is hooked to the hose and the other to the hoee cart, and in lees than five minutes' tims the hose ie on ths top of the houss; ths firsmen asosnd the ladder to the roof, or to either story, as the oass may require, and play their stream on the fire, without waste of time or water. And this may he done from the ontside of the huilding, without opening a door or window on the ground floor. The laddsr remains intact and ssrviceabls as long as the walls stand. For eaving life and valuables this machine is sspecially adapted. As the laddsr and shaft will sustain a weight of from 7,000 to 50,000 pounds, anything from a piano to the smallest article can be lowered upon it. In hotels, or huildings occupied for officee or slseping rooms, a stout web etrap is provided to be strapped around the breast under the arms — of an invalid or timid person, unwilling to dsscend the ladder, to which is fastened one of the hooks in the end of the hose elevator — whils the other is held and controlled hy parties on the ground helow. — *Am. Manufacturer.*

A Miners' Association has been formed at Alta city, Utah, having for its ohject the protection of miners in the mattsr of wagss. They want to keep minere' wages at a standard price of $4 per day, when they hoard themselves, or $3 per day and hoard. It is proposed that the league extend all over the Territory.

The Eagle Mine at Morris Flat, turned ont a gold apscimsn worth $600 the other day.

Geological Report.

Ths biennial report of J. D. Whitney, ths State Gsologist, has been forwarded to the Govsrnor, and the Sacramento *Union* furnishes the following summary: Ths last report was dated November, 1871, and defined the state of ths work at that date. The first thing which sngaged the attsntion of the gsologist and his assistants thereafter was the complstion of ths "map of Central California," which is embraced in four sheets. The southwest quarter had been previously finished, and the eoutheast quarter was in the sngraver's hands. The northeast quarter was nearly all drawn in the spring of 1871, but thsre remain a few hundred equare miles ahont ths heads of the Carson rivsrs, which had not beeu mapped, as well as a narrow strip in Calaveras and Alpine countiss, which rsquired a more detailed examination than it had received. To do this the gsologist crossed ths mountains through Walksr's Pase early in the spring of 1871, and while on the eastern elope passed through Owen's valley and sxamined the effects of ths Inyo earthquake of ths preceeding March. The work was dslayed by the prsvalence of enow on the mountains until July. It was complsted by H. Craven before the end of July. The drawing of the map wae then taksn in hand by Hoffman. The second, or southeast qnartsr was finished during ths summsr of 1873, and ths third or northeast quarter, is now in the sngravsr's hands. Two sheets ars therefore now on sale and ths third will he in about thrse months. The line work of ths fourth ehest is also engravsd, so far as ths same has been drawn. Thsre still remaine oue summsr's work to hs done bsfore ths sheet oan be completed. The whols of the map can bs finished by February, 1875. Thns the great work which has engaged ths dspartment sincs 1862 can be completed. This does not, however, embrace all ths work that has hssn dons, ae Hoffman has heen engagsd in the projection of another map of the southern part of the State, embracing considerabls work in the Coast Range, and including the valuahls explorations of the Southern Pacific Railroad Company hy Butlsr Ives, aud tbat of other surveyors. The "map of ths vicinity of San Francisco" has been carefully corrected, inoluding the changes in mnnicipal townships, ranch boundaries and railroad lines. The Stats map, on a scals of 18 milee to the inch, has bssn completsd. This map also includes a map of the Stats of Nevada. The novslty and beauty of ths map has bsen rsmarked by those who have had an opportunity to inepect it. A smaller map, on a scale of 36 miles to the inch, has also bsen engraved. For ths want of msans but little has been done within ths last two years in the way of new gsological work. Two objects have been kept in view during this psriod—one, tbe coloring of the map of ths whole State, and the other ths completion of the geological map of a portion of the mining rsgion. Ths map of the principal mining countise hae not been completed for want of means. But a map of the region emhracing ths moet important hydraulic mines has bsen completed hy Hoffman from the surveys of Bowman, Pettss and Goodyear, and from information obtained from the surveys of ths Central Pacifio Railroad Company. It is in the sngraver's hands. Soms smaller diagrams havs also besn finiehed and sngraved. Certain important haromstrical observations have also been mads. Considerable geological work has also been done by Goodyear and Cooper in the southern part of the State, commencing at San Diego. A map has been made from the engraved plats furnisbed hy the Coast Survey, which is in ths engravsr's hands. Dr. Cooper hae been engaged on the geology of tbe region about the bay, and a map mads and colored geologically, which ought to he published. A geological map of the whols State, not yet pnblished, has also heeu made. To ohtain matsrial for a new *Yosemite Guide-Book*, Whitney, Hoffman and Craven visited the bigh Sierrae in Mariposa and Tuolumne counties. It would bs very convenient to travelere if a horss trail could be constructed through ths whole of Tuolumns cañon. The numher of pleasurs travslers is conetantly increasing, as is also the dsmand for the *Guide-Book*. Ths botanical work is well advanced toward publication. E. S. Watson, Professor Brewer and Dr. Gray havs been employed on this work. The cutting on wood of illustrations of ornithology is progressing slowly. The collection of fossils has heen placed in ths hands of Lesquereux for examination and description. Ae eoon as his work ie completsd it will form ths third volums of the paleontological eeries. But little that ie nsw can be reported of the volums of icthyology and conchology. A number of illustrations in gsology have hssn cut on wood or lithographed. On account of the unwillingness of the Legislature to appropriate sufficient meane the Stats Geologist has determined to close his oficial connection with the State as soon as the mape and volumee now in progress have heen completed, certainly hy June 30th, 1875. He hopes, therefore, that the means will bs furnishsd early in the sssion to finish the six additional volumes, with the atlas of maps with ections sngraved, illustrations, etc.; and unless an appropriation is made hsfore the end of Jannary the moet of the work now in progress mnst he stopped. He will at once deliver to the State University the collectione in hie possession: Not less than $100,000 will be required to complete the work already hegun and in processs of publication, which will include the ssvsral maps and ons volume on physical and general geology, ons volume on economical geology, one or two volumes on ornithology, one or two volumes on hotany and one on fossil plants. On no pretense will he ask for another appropriation from the Stats. If these works are finished by 1875 the proceeds dsrived from their sale would insure the completion of othsr important works within ths following two years. For this extra work he will give his supervision free of charge.

Sugarie Closed.

Aftsr au sntirely successful ssason's run, the Sacramento Sugarie closed out its last ton of hests on Friday, Nov. 21st. We wsrs prssent the day before its stopping, when they were driving it to its fulleet capacity in order to make a closing up that week. To say tbat the company has fully demonstrated ths entire practicahility of beet sugar making ou ths Pacific coast is telling but half the story of its euccess. Here we have a eugarie with ths best, improved machinery for sugar making, with a rated working capacity of 50 tons of bssts in 24 hours, actually turning off 75 tone of besta in 24 houre, and in ssveral instances, whers ths size of the beets wae favorahle, as many as 80 tone. Now it ie clear to any ons who can maks figures, that this power to work np ths raw best into sugar call for an immense quantity of bsets to keep snch a sugarie in operation for six months of the ysar, and the sxperience of this ysar has fully established this fact; for though it was believed ths company had sufficient material to kesp the sngarie in constant operation till February at least, they find themselves already out of beete, with at least two more of the best monthe of ths ysar hsfore them in which to make sugar.

Here is an error of management now clearly ssen, and ons which will be mst and remsdied another year, by a largely increassd acreage of beets. To posssss a sugaris with the capacity that this one hae, for the successful manufacture of sugar of the vsry finset quality, eqnal in all its higher grades to the hsst cane augar, and tben run it only four out of the six months of ths regular sugar campaign, where so large a capital ie invested, ie not the kind of managsment to insnre the fullest success. Hsrstofore the full capacity of the machinery has evidently been underrated, or a supply of bssts would have bsen secured eqnal to the need. There is csrtainly land enough on the lines of the sevsral railroads that csntsr at Sacramento, to furnish all ths bests the sugaris may need for a full working season, and it has bsen demoustrated that thsy can be deliversd by rail from a distance of 20 miles ae chsaply as hy teams a distance of one mile. We predict the fullest success to the future of heet sugar making in California; and now that the Sacramento sngarie has finished ite work for the season, we may look for the usual rise in ths prics of eugare incident thereto.

Practical Use of the Carbonic Acid Resulting from Fermentation.—E. Pfeiffer has devised a plan for economizing the waste carbonic acid reculting from ths fermentation of wort, the manufacture of vinegar from champagns vats, and ths like. Ths fermenting veesele are coversd, and, hy msans of exhausters, the air is drawn off and is found to oontain from twenty to twenty-five per cent. carhonic acid. This can servs for ths manufacture of bicarbonates, and, if ths gas were to be condsnsed, could be converted into a motive powsr, employed in the manufacture of eoda water, or used for artificial refrigsration. At any rate, there would appear to he no reasonable exense for wasting so much carbonic acid. If somebody would only deviss a practicable plan hy which the enormous amount of carbonic acid, produced by gas burners or exhalsd from the lungs of large audiencee in our churches, theaters, and public halle, could hs drawn off, got out of the way, and devoted to some purpose more useful than suffocating and poisoning multitudes of people, he would confer a great hoon on mankind, and would be cordially welcome to any remuneration hs could make ont of it. In other words, why cannot somehody deviss a system of vsntilation that will be accepted at once as feasible, and thus put a stop to oomplaints on this subject?

Mr. P. Brotherhoon, of Notting Hill, England, has lately patented an improvsd application of steam power, hy meane of which hs applies the steam directly to centrifugal and other rapidly revolving machines, without multiplying gear. Three eteam cylindsre are arranged with the axse intersecting at angles of 120°, so that their pistons act on one crank within a cavity containing eteam which pressss constantly on one side of the piston. The crank drives a rotary slids, by which steam is successfully admitted to, and allowed to escape from, each cylinder, whereby continuous rotary motion at high epeed is imparted to ths crank ehaft. The crank shaft is coupled or attached to the revolving hasket of a centrifugal machine, the driving apparatue being placed either under or ahove the centrifugal machine, and arrangemente are described for allowing for shake or eccentricity and rslieving tbe weight of the rotating parte. Similar apparatus is applied to driviug other rapidly rotating machines, such as fane, circular sawa, threshing machinee, rotary pumps and propsllers, and the like, hy extending the driving shaft, so that its extensiou constitutss the shaft of the machins to be driven, or hy connecting the two ahafts by any known coupling.

Good Health.

Phosphorus as a Nerve Tonic.

In the course of a papsr npon the results of overwork, read beforo the London Medical Socisty, Dr. Ronth said: The symptoms of metal dscay rosomble the gradual change that comss over old people, and yet arc very similar to those induced hy vsusreal excesses. In both cases, the tendency is to the productiou of idiocy from softening of the brain and insanity. He said there was reason to believs that tho immediato causo of these symptoms was deficienoy of phosphorns in the brain, aud endeavored to prove this by oonsidering *seriatim* the following points: 1st. It is proved chemioally that a man grows older and mentally weaker, or becomes idiotio, as the hrain contains less phosphorus; this is showu hy the analysis of Hontier. 2d. The solidity of the brain is in a measnre dependent upon protagon, a phosphorized compound; and those foods which were richest in phosphorus were found hy experienco to renovate most speedily weakened hraiu-power, sach as shell-fish and fish generally. 3d. The assertion made hy some that phosphorus could only he assimilated by previons conversion into phosphoric acid, was ormbated, the effects of the two heing shown to he perfectly different; phosphoric acid producing, in large doses, fatty degeneration of the heart, liver, and kidney, whereas phosphorus produced necrosis of the jaw-hone, and excited the nervous and sexual systems. The opinion of Dr. Von Bibra was slso quoted in evidence of this. Phosphorus also redaced or removed congestion of the brain. 4th. Dr. Roath next showed that those diseases produced by softeniug of nervons matter were precisely those which were cured sometimes by the internal administration of phosphorus—namely, some forms of paralysis, eczema, aud other skin affections, cerebral congestions, with great debility and insomnia. The aathority of several writers was cited on these points—Delpech, Prof. Fischer, of Berlin, Dr. Eames (in the *Dublin Journal*), Dr. Bargess, and Dr. Hammond, of New York. 5th. The special treatment indicated in these cases was next considered: 1st. Complete rest of mind, especially abstention from all occnpations resembling that npon which the mind has been overworked; 2d. The encouragement of any new hobby or stndy not in itself painfnl, which the patient might select; 3d. Tranqaility to the senses, which expressly give in these cases incorrect impressions, putting only those objects before them calculated to soothe the mind; 4th. A very nourishing diet, especially of shell-fish; 5th. The internal administration of phosphorus, whether in its allotropic form, or as the "Solutio Phosphori Medicati," prepared according to Dr. Hammond's formula.

Hygienic Properties of Hard Water.

The *Journal of Applied Chemistry* remarks upon the popular prsjndice that hard water is dangeroas to the health, and on that account we are constantly warned by physicians to beware of it, bnt in England, one of the leading authorities on this subject, Dr. Letheby, after devoting many years to an investigation of the properties of the water introduced into English cities, and to a study of the sanitary reports on the snbject, comes to the conclusion that moderate hard water is safer and healthier than soft water. Hard water is not only clearer, colder, more free from air, and conseqnently more agreeable to the taste than soft water, hut is less likely to absorb organic substances, to sustain the life of zymotic organisms, or to exert solvent properties npon salts of iron or apon leaden conducting pipes. The lime salts exert a beneficial inflnence upon the animal economy, and even protect the system from dangeroas outward influences. Dr. Wilson of Edinhargh has also collected mnch valnable material on the subject, and comes to the same conclasions as Dr. Letheby. He takes the ground that the human body reqnires for its nourishment and support a supply of certain mineral salts, among which carhonate and phosphate of lime play an important part in building up the compactness of the bones and in other fnnctions. We usnally obtain phosphate of lime in our animal and vegetable food, bnt not from water we drink. Carbonate of lime, however, is not contained in adeqaate quantities in our solid food, but generally obtains in spring and well water.

It has heen incontestably shown that in mountainous districts, where the water is more or less hard, the inhabitants exhibit the best physical development. On the other hand, it is believed that in large cities the mortality is inversely as the hardness of water supplied to the inhahitants. A water which contains about six grains of carbonate of lime to the gallon is snitable for nse in all household purposes. As a drink and for cooking food, snch a water offers the necessary carbonate of lime for the support of life in the simplest, most natural and most easily digested form, and is at the same time more agreeable, fresh and sparkling. It is evident that oar preconceived popnlar notions on the snbject of hard water need revising, and that it may he better to nse such water than to have recourse to rain or ice water.

Advantage of Crying.—A French physician is out in a long dissertation on the advantages of groaning and cryiug in general, and especially during surgical operations. He contends that groaning and crying are two grand operations hy which nature allays anguish; that those patients who give way to their natural feeling, more speedily recover from accidents and operations than those who suppose it unworthy a man to hetray snch symptoms of cowardice as to either groan or to cry. He tells of a man who reduced his pulse from one hnndred and twenty-six to sixty, in the course of a few hours, by giving full vent to his emotions. If people are at all unhappy about any thing, let them go to their room and comfort themselves with a load hoohoo, as they will fsol a huudred per cent better afterward. In accordance with the above, the crying of children should not be too greatly discouraged. If it is systematically repressed the result may he St. Vitus' dance, epileptic fits, or some other disease of the nervous system. What is natural is always useful; and nothing can he more natnral than the crying of children when anything occnrs to give them either physical or mental pain.

A Discovery in Cancer Therapeutics.—The cancer has long heen a disease beyond the power of the physician. Its treatment has been empirical and unreliable. The remedies employed have been painful, dangerous and almost always unsuccessfnl. Under these circumstances, the discovery of a new method of treating cancer will be hailed with general satisfaction hy patients and physicians. At the last annaal meeting of the New York Medical University, Prof. Scott read a paper in which he stated that repeated experiments had demonstrated the marvellous efficacy of the application of chloride of chrominm incorporated into stramoniam ointment. This preparation, in a few hours, converts the tumor into perfect carbon, and it crumbles away. The remedy caases no pain, and is not poisonous. It promises to alleviate mnch haman misery, and we call the attention of the entire profession to the fact of its discovery. —*Druggists' Circular.*

Useful Information.

Strength of Cement.

Professor Baaschinger, of the Polytechnio School of Manchen, has lately made experiments (in the technical laboratory of that institution) with mortar of Perlmosen Portland cement and water lime. Cuhes of pare cement, as well as of mixtures of one part cement with sand or rubble ap to five parts, were snbmitted to pressure. The resistance of pure cement was found to be grsater than that of the mixtare in the proportion of 1:5; it diminishes very slowly, even if as mnch as three parts sand (even coarse rubble) are added. Cubes of water-lime and coarse rubble were found to resist pressure best, mixed in the proportions of 1:2 or 1:3, pure water lime offering the lsast resistance. The resistance to pressure in a mixtare of the proportion of 1:4 is nearly as great as in that of 1:1.

Cnbes of brickwork, made of common bricks and mortar of oae part lime-water and three parts of fine sand, after hardening for ninety days, were next tried, when it happened that the mortar remained firm, whilst the bricks were orushed.

Slahs of one part cement and two parts fine sand, ahout 1½ in. thick, also, after setting for ninety days, were likewise experimented upon, and the resalts showed that the strength per square unit increases with the dimensions of the cross section, but it is also determined by its form, and diminishes somewhat with the thickness of the slab. Similar experiments with cement prisms likewise showed that the strength of rupture of cement increases if it is mixed with sand in the proportion of 1:3, and even that of mortar mixed in the proportion of 1:4 is greater than that of pure cement.

In the trial with slabs made of one part cement and two parts fine saad it was found that they possess equal strength whether they rest on all fonr corners or only on two edges, and that the resistance was nearly proportional to the sqnare of thickness of the slabs. The slabs were tried after hardening for 105 days; the prisms after 90 days. Professor Baaschinger intend publishing an empirical formula as soon as a sufficient nnmber of experiments are available for the purpose.

According to M. Offret, in batswing burners it is found that, though the size of the flame diminshes with the amount of gas consumed, it is not in equal ratio. The cost of a large flame for each candle power per hour may be, for instance, 0·42 centimes, while with a small one, it will be 0·897 centimes. Or, again, the light of a large flame may be equivalent to fifteen candles, while that of two small ones together will be 7·4 candles. The cause of this is attributed to the complete combustion of the gas in the blue zone in the gas flame, which gives little or no light in either case, and has more favorable circnmstances for its occurrence relatively to the size of the flame in the small than in the large flame. Another more inexplicable phenomenon is that with a flat flame the intensity of the light is the same, whether the edge or the flat of the flame is tested. This points to the absolute transparency of the flame. The nse of cylindrical glass chimneys with ronnd jets (argand, etc.,) is concluded to he, on the whole, somewhat more economical than with flattened ohimneys, after a series of experiments to settle this point.

Wasp Trap.—It sometimes hecomes desirable to rid one's premises of the anpleasant presence of numeroas wasps, and here is a way to do it as suggested hy a cotemporary: Mount four panes of glass of equal dimonsions in tin framing (like a lantern), leavs the top and bottom open, cover the latter end with thick white paper well attached with strong water-proof glue, and the paper well oiled, and protected from damp or fire. In this make a hole about six inches in diamster, and then place this hole over a plate, on which three pieces of bricks are put; in this plate you will have pnt a mixture of beer, sugar and a little rum. On the top and you will have fitted in a glass pans, removable at pleasure, to clean the tray. Now prepare some long matches of stout paper dipped in brimstone; when your trap is "all alive" with captives, ignite a match and pnt it under the hole; they will soon suffocate. Each day empty out the contents for your pet toad's dinner. I once saw a most ingenious insect-catcher in Africa, invented hy some English artisan. There was a wire-work dome like a meat cover; just below it a roller covered with cloth; satarated in syrup, slowly revolved when the clock-work adjustment had been wound up. Into this "Syrens' cave" every flying thing tempted to settle on the sweet stuff was unconsciously drawn, and the cage was soon a museam of Diptera and Hymenoptera! There was a trap-door at which the suffocating operation was carried out (as in the first mentioned trap.) It was altogether a great success.

Home-Made Horse-Powers.—The cheapest way to make a horse-power for dairy and other light use, is to put a light dram on a center post, high enoagh to have the belt clear the horse's head. Attach a sweep ten or twelve feet long to the center post, so that the track in which the horse walks will be from twenty to twenty-four feet in diameter if possihle. Let the track be soft ground. The whole arrangement made he made of white pine, except the sweep, which should be hard wood. Let the drum be about ten feet in diameter and six inches face. Use a two-inch rubber belt. Make a small pulley from four inches to a foot in diameter, according as you want fast or slow motion. If you want the motion still faster, gear ap with a second belt and set of pulleys. The direction of the motion may he changed by a quarter twist in the second, or by passing the first belt over the idle palleys. This arrangement will be almost noiseless, while the clatter and jar of a circular platform wonld he enoagh to drive a sensitive or nervous person almost crazy. Besides it is much easier and safer to teach a horse to follow a circular path than to keep his balance on a revolving platform.

To Clarify Wine Intended for Vinegar.—The *Druggists' Circular* replies to an inqniry on this topic: Oar correspondent has some sonr domestic wiae he wishes to turn to vinegar, hut he wants to get rid of the coloring matter, lest it may interfere with the quality of the vinegar. It is hardly worth while to take that trouble, for the wine will of itself become clearer and clearer in measure as it turns into vinegar. The coloring principle of wine, being mnch less solable in acetio acid than in alcohol, will precipitate gradually when the acid is formed at the expense of the alcohol; so that, when all the alcohol shall have been destroyed, very little coloring matter will remain in solation—not enough at any rate to injare the appearance of the vinegar. If, however, white vinegar be desired, the liquid may be bleached easily by means of bone-black, previously washed with dilate muriatic acid and distilled water.

Water for Houses.—Speaking of water snpply and drainage, Mr. Roberts, in a paper read bsfore the Royal Institute of British Architects, stated that well drained clay is a better site for a house than gravel. The explanation is, that wells dug in clay soil contain purer water than wells in gravel, for the surface water will not soak through clay as it does in gravel. It is well known that wells in a gravelly soil are liable to contamination by soakage from the surface. But the healthfulaess of the honse, no less than the purity of the water, depends on thorough drainage of the clay. As regards rain water, Mr. Roberts recommends that instead of allowing it to run from the roof to the ground, and then pumping it back for nse in the house, the best way would be to construct a cistern on the roof, into which the rain water could flow of itself.

Removal of Gum from Silk.—Formerly raw silk was hoiled in bags, in a solution of soap, whereby its gloss was freqaently injured. Afterwards this process was modified by exposiag the silk to the action of steam after having been impregnated with Marseilles soap. The removal of the gum from raw silk has since then been still further simplified, and requires neither boiling nor steaming. The silk, snspended npon sticks, is moved about for a qnarter of an honr in a hot bath containing a quarter of a ponnd of soap for every ponnd of silk, and then treated in the same way in a second hath, containing only one-fifth poand of soap for a pound of silk. Simple as this proceeding is, it has nevertheless been found snccessfal in rendering the silk soft, smooth and of higher gloss.

Domestic Economy.

Washing and Bleaching.

It may sometimss hscome necessary or convenient to hloach a pisce of cotton cloth, though as a general thing it is bettsr to ohtain whits cloth already hlcached. Homehlsaching, moreover, is apt to injars the fabric more than the process in uss at the factories, espscially when manipulated, as it always is there, hy skilled hands. However, cloth may he hloached as follows: — To five pounds of cloth take twelve onnces of chloride of lime. Dissolve the lime in a qaantity of hoiling water; when oold, strain it into a suffioisnt quantity of water to cover the oloth. This must first be boiled fiftssn minutes in stroug soapsuds, and rinsed well in cold water. Then put it in the lime water from ten to fifteen minutes, airing it well by lifting it up and down. Rinse well in warm and cold water.

Dr. Artus says that flannel which has become yellow with use may be whitened by putting it for some time in a solution of hard soap, to which strong ammonia has been added. The proportions he gives are one and a-half pounds of hard curd soap, fifty pounds of soft water and two-thirds of a poand of strong ammonia. The same object may be attained in a shorter time hy placing the garments for a qnarter of an hour in a weak solution of bisulphite of soda to which a little hydrochloric acid has been added.

According to the *Moniteur Scientifique*, an excellent substance for washing linen, and one not possessing the destructive effect of soda and other washing powders, is prepared as follows:—Two poands of soap are dissolved in five and a-half gallons of nearly boiling water, and to this is added three large tablespoonfuls of ammonia and one of spirits of turpentine. In this the linen is to be soaked for three hours, when it is readily cleansed, reqniring hat little rubhing. Ammonia does not affect linen or woolen fiber as soda does.

And a writer in the *Western Rural*, on the same subject, says:—Pat yoar clothes in a good snds the day before washing; in the morning wash out of the water, warming it by the addition of hot water, if desirable; pnt into hoiling water, let them boil ten or fiftesn minutes; wash ont of the boil snds with the hands; rinse, hang ont and dry. I have washed in this way for some years and am always enccessfnl in having white clothes, and getting my washing ont early in the day.

A recipe for bleaching muslin is as follows: One ponnd chloride of lime to forty yards of muslin; soak the maslin in soft water over night, melt the lime in a pot of water; then strain it in a tub of soft water; then put the muslin in for half an honr; then rinse three times; soak in soft water over night; then hang out to dry.

To Preserve Grapes.—It is said the best manner of keeping grapes fresh for winter nse is the method pursued in Spain, namely, to pack the entire clusters in thick, open mouthed stoneware jars, laying dry, putting fresh hardwood sawdust between them so thickly as to fill ap all interstices; then to place the jars in a cool, even atmosphere, excluding all light. Some practice the following method: Cutting the clusters just before they are entirely ripe, dipping the eads of the stalks into a mixture of hot resin and sealing wax and suspending them in a cool, dry and dark atmosphere. It is not known to every one that the grape can be put up like other fruits for winter use. But try it and see. There is no fruit easier to manage this way, or that retains its natural flavor and excellence hetter. Make a syrup of a qaarter of a pound of sugar for one pound of fruit; pat the grapss whole into the scalding syrup and skim oat soon, and let them partly cool, and then can them as you would any other fruit. If yon wish to have the pulp clear of the seeds, yoa have only to run it through a colander. Nothing in the line of canned fruit makes a more healthy and palatable pie than the grape prepared in this way, or with less trouble.

How to Make Toast.—A dish of good toast is a rarity and is an enjoyment. For breakfast few things surpass it to those who are accustomed to that dish at that meal. It is light, digestible and reliable, and is not very expensive. A cap of good tea or coffee, with a baked Spitzenburg, or a dish of any other subacid in addition, will make a satisfactory meal to a reasonable man. In toasting bread the following rule should be observed: Warm yonr bread well, by changing the sides of the slice when heated through, brown as is desired —there should be rather little than mach browning, and the slices shoald be quite thin, say a quarter or three-eighths of an inch, no more. Bat do not scorch; avoid that in all cases. The philosophy of browning is to take yoar time nntil yon are done. Where the toast accumnlates keep a hot dish, but nse as soon as possible. What is desirable in toast is the rich color and flavor formed by changing the starch into dextrine or gum. Heat evaporates moisture in bread as well as elsewhere. The moisture that escapes from toast leaves the bread light, soft and porous inside.

Rice Pudding.—Half-pint of rice boiled; drain off the water and let the rice got cold; two ounces outter, four onnces sngar, one-qnart rich milk, five eggs beaten very light, a tablespoonfnl of nntmeg and cinnamon. Stir all together.

TABLE OF CONTENTS.

GENERAL EDITORIALS. — Concentration of Ores—California Mills in Europe; The Hoosac Tunnel; our Mining Laws, 353. San Juan Mines; California Gravel Mines in England; On His Own Hook; Hunt & Douglass Process, 360. Proposed New System of Wharves for San Francisco; Snow in San Francisco, 361.

ILLUSTRATIONS.—California Battery in Europe, 353. Map of the Proposed New System of Wharves on the Water Front, 361.

SCIENTIFIC PROGRESS. — Vaseline—A New Prodnot of Petroleum; Astronomical Notes; Purity of Water; Rusting; Varying Intensity of Solar Light, 355.

MECHANICAL PROGRESS. — Car-Coupling; The Rights of Inventors; Regulator for Car Lubricators, 355.

GOOD HEALTH.—Phosphorus as a Nerve Tonic; Hygienic Properties of Hard Water; Advantage of Crying; A Discovery in Cancer Therapeutics, 359.

USEFUL INFORMATION. — Strength of Cement; Wasp Trap; Home-Made Horse-Powers; To Clarify Wine Intended for Vinegar; Water for Houses; Removal of Gum from Silk, 359.

DOMESTIC ECONOMY.—Washing and Bleaching; To Preserve Grapes; How to Make Toast; Rice Pudding, 359.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 356.

MINING SUMMARY from various counties in California, Nevada, Idaho, Utah and Montana, 357.

MISCELLANEOUS. — Hill's Separating Works; County Aid to Mining Interests; Iowa Hill Canal; Tallow-Cheese; A Success; Rumored Sale; Robinson District; A New Steam Engine; New Hoisting Works, 354. Egan Canon, Cherry Creek, Ruby Hill and Robinson; A Valuable Invention; Geological Report; Sugarie Closed; Practical Use of the Carbonic Acid Resulting from Fermentation, 358. The Salmon Breeding Enterprise; The Belcher Mine; Cost of Materials in Various Manufactures; Giant Powder for Fishing, 362. Narcotics and Stimulants; Mining Decision; Platinum Bronze; An Important and Cheap Source of Potash, 363.

The San Juan Mines.

The San Juan mines continue to attract considerable attention and numbers of people are seid to be going there even at this time of the year, when every thing is frozen up. They probably think "first come, first served," but we are of the opinion that prospectors looking in that direction had better wait until spring. If there had heen any thing to he gained in the country during this winter, the people who were there would not have left to return next year. There are only a few hrush mioers' huts, etc., in the country as yet and as the roads are in no condition to travel over in the winter months, a residence at the miues can not he very desirable at present. If the country is half as rich as represented there will he plenty of room for miners early in the spring.

In this connection we notice a report in the Puehlo *Chieftain*, stating that the Little Anuie mine in the San Juan country has been sold for a large sum. The price stated for two-thirds of the mine is half a million of dollars. The mine was firet hought by a Mr. Adams, Indian Agent, from the original locators and he sold it to English capitalists for the amount mentioned. The *Chieftain* eaye: "The sale was made to European capitalists who are prepared to pay cash. Mr. Adams' venture in purchaeing mining property in southern Colorado has heen followed by happy results, and the whole transaction ehows that he ie a men of firm business tect, nerve and foresight. It shows also that he hae entire confidence in the San Juan country, as a mining section, aud his busineee relations with the Utes for the past few years has given him an opportunity to fully investigete the country and its mines. It is impossible to overrate the henefits that will accrue to the mining districts of southern Colorado, hy this important transaction."

THE OREGON Iron Works, of Portland, have olosed out busiuess and ths property of the oompany is to be sold.

California Gravel Mines in England.

We are very much pleased to see from our Englieh exchangee, that Celifornia hydraulic mines are in great favor with English investors. The shares elready on the market are in steady request, and investors are becoming alive to the feet that there is less risk in this class of miniug than in any other. The mines of gravel are generally well defiued and pey very regularly. The English papers state that the hydreulic mines "are the hest clese of Americen mining property yet introduced in this market." Sweetland Creek hes paid nine shillings and has another five shillings per share, ready to pey at the ond of this mouth as dividends. Birdseye Creek, which has done a great deal of "dead" and expensive work, paid three shillings during the year. Cedar Creek paid 12½ per cent. this year on its present price. The net profits for the seeon were £12,000, aud the tunneling and sinking done this year, not required next, wae very extensive. The two dividends of Cedar Creek this year amounted to £8,000, the gross yield of gold being £34,000. The mine was left in a very bed state hy the former owners, and it cost considereble money to put it in order. It ie proposed to run a tunnel 2,900 feet long, similar to the one which has been so euccessful at Sweetland oreek.

A new company hae recently heen incorporated called the Blue Tent Conealidated Hydranlic Gold Mine of California, with a capital stock of £150,000 in £5 shares. The property of the compeny embraces about 490 acres of auriferous gravel on the South Yuba river, about five milee from Nevada city. Tho consolidation is made up of ja number of smaller properties, formsrly held by various owners. On some of these smaller claims superficial workings have been going on for ten or twelve years hut on only a few of them hes hed-rock heen reached. The company embrace in this property the water rights now owned, and those within the command of the property. Aleo all tho improvements and explorations made upon the property consisting of sluices, tunnels, shafts, flumes, dumps, iron water pipee, hydraulic apparatns, derricks, tools, ehops, storehouses, hoarding housee, etc.

Profeesor Silliman has reported on the prospects for the English owners and computes thet the $770,000 worth of gold obtained from the severel claims was derived from washingdown 5,101,150 cubic yarde of gravel, much the larger part of which was top gravel, from 300 to 350 feet above bed rock. The eetimated value of such gravel ie placed at 10 cents per cubic yard. The general average by actual measurement gives 15 cente per cubic yard. He arrives at the data necessary to calculate the probeble time which the mass of gravel in this property will last, if worked at a certein rate. Thue:—5,101,150 cubio yarde worked, divided hy 2½, equals, 2,186,207 cubic yards, the quentity for one yeai's dividends on the company'e hasis, thereforo, 415,866,359 cubic yarde of reservee, divided by the above quentity, for one year, will give 190 years as the length of time which these reservas will last, if the rate of consumption estimated is maintaincd. But it will he remembered that as the waehinge approach the bed-rock the gold product increases, and the rate of washing becomes slower, beceuse the lower gravel is harder, so that the aotual time required to wash off the whole mass of gravel will probably exceed by several yeare the period now calculated.

Mr. G. D. M'Lean (Superintendent of the Sweetland Creek) etetes thet the gold-bearing gravel attaine a maximum thickness of 1,000 feet. The 490 acree comprising tbe area are almost entirely overlaid with alluvium, but in order to compensate for the exheusted pits, end any points where the survey may overlap the rim rock, we will lessen the area to 400 acree, ae a hasis of calculation, and the average depth to 225 feet. In 400 acree of gravel, 225 feet deep, there are 145,200,000 cubic yards, which including all of the richer under strata estimated at only 15c. per cubic yard, the average obtained from the 5,158,150 cubic yarde exhausted, gives $21,780,000 gross as the returnable oontents of the property. Suppose three monitore, under a preseure of 300 feet, to discharge each 1,000 in. of water, and to wash jointly 9,000 cubic yarde per day of 24 hours, aud to operate continuously for 10 months; over 53 years would be required to exhaust the property, whereae if the additional depth of the placer was estimated at 10c. per cubic yard, the amount returnable would bo over $33,000,000, and 94 years or more would he required for the displacement. The expense usually attending hydraulic operations is from one-fourth to one-tbird of the gross returns—the water belonging to the mine.

Owing, however, to the difficulty of obtaining any reliable data for estimating the value of deposits hy the cubic yard, a more satisfactory mode of computation of returns atteinable in working auriferous gravels is found in the net profits of a given quantity of water used; 30c. profit per inoh, or $300 for each 1,000 in., miners' measure, of water ueed for 24 hours may be sefely calculated upon from average gravel waehiugs. Upon thie plan of calculatiou, for safety, shorteuiug the water season to eight months, and limiting the supply to 3,000 in., we have a net profit from this property (supposing the washing to be contiuuous) of $216,000 per annum.

On His Own Hook.

The White Piue *News* says: "Mr. Ellis, owner of a mine near the old eite of Mount Ophir, has concluded to save the amount of monoy expended in carrying his ores to Eureka for crueh-ing, hy erecting a mill of his own. Our friend, John Foley, an engineer well known in this eection, informe ue thet with infinite trouble and pereistent effort, the neceesary adjuncts of hoiler, engine and other fixtures were obteined from various portions of the counry, and a 2-stamp mill put up near the mine. Mr. Ellie proposee to he his owu engineer, fireman and mill-men, crushing his own rock and making it into eelahle bullion. We are informed he has engioe and boiler power enough to run a 5-stamp mill, should he conclude to make eddi-tions to the present iustitution. We only hope he may soon run a 40-etemp mill and have ore enough in his mine to run the same during the remainder of his life."

We admire his pluck, and only wish it was possible for the custom to hecome more general of the miners having their own little mills, if only 2-stamp oues. Still they cannot always make milling their own rook pay, even if they can afford to put up the mill. Running a quartz mill successfully is not much eesier work than Mark Twain found it to feed a hattery at $10 per week. He asked for a "raise" of $400,000 e week, and some men oannot make a big quartz mius pay with that sum to back them every year. The hundrsds of idle quartz mills throughout this State fully attest that fact. Miners generally understend much more about sinking shafts, running tunnels and drifts, timhering, etc., than they know ahout milling or working rock, and when they come to try it "on their own hook" are apt to make a failure.

Woremember a ciroumstance whioh happeued to a certein California "gold camp" which will illustrate our meaning. The men struck a nnmher of small but rich ledges in a part of the district which had not heforo heen prospected. The eide of the cañou where they were sitnated was very precipitous and covered with thick hrush and loose piecee of slate, making travel difficult. There were no mills where they could conveniently haul tbeir rock and poor chances to build any roads. A creek ran along the bottom of the cañon, which gave pleuty of water for milling purposes but uot enough for power. Some eight or ten arastrae were made near the creek, the rock was sorted up on the mountain and the best of it packed down on donkeye to he crushed. The rock was first burned and theu suddenly cooled in water, which greatly assists the crushing. Some of the arastras were run hy one horee and some by two. The men who owned the ledges were in parties of four to eix and with the crude way they worked their rock they made from $50 to $100 clear per week apiece—very handsome wages.

This went on for several months, when the men thought they ought to have regular quartz mills so as to get more rock through. Accordingly three five stamp mille were built, one of them, however, with wooden stamps. Five or six months after not one of these mille was running. The men who owned them hegan to run in deht as soon as they started up, and were in the end oompelled to sell their mills. True, when the ledges widened out they were not as rich as on the surface, nor was the rock sorted. Expensive roads were built and operations considerably extended. While going on in a modeet way they made money; when they were owners, mill men, contractors and all together, they made a failure of it.

This, however, is no argument that every body cannot run a mill, for in the same camp there are to-day two small mille running which were built hy mine owners and they have mede a profit out of them. The trouhle with small companies is the same as with large onee, they are generally in too muoh of a hurry to build their mills, aud often do so hefore they know whether they have any mines or not. Every old miner on this coast knows thet this is one of tho great drawhacks to mining operations and has done much to hring them into disrepute. When, however, a man sees his way olear to huild a small mill and run it himeelf we like to see him do it. It gives more of an air of permanency to any district to see a numher of mills, and when mine owners have their own, they are more liable to he permanent citizens, than when they depend on cuetom mills to do their work.

THE Mineral Hill Mining Company are employing some 30 or 40 Indians, and paying them at the rate of $30 per month.

The Hunt and Douglass Process.

We gave some time since a detailed description of the Hunt & Douglass, or "Regenerative" process of extrecting copper from its ores. The advantages of this over other wet processes are claimed to he ae follows: 1st. With it, neither acid nor common salts ie requir-ed to dissolve the copper. In the ordinary wet process the oxidized copper ie dissolved in hydrochloric or sulphuric acid, or the ore is celcined with two or three tons of salt to each ton of copper. In the Hunt & Douglass the solvent employed is the protochloride of iron (neutral) which is continually regenerated hy the act of precipitation with only a trifling loss. 2nd. Less than half the quantity of metallic iron is required to précipitate the copper than is necessery in acidulated solutions. 3d. Tho only operation in which fuel is used is in the calcination of the metals, and only a very small quantity in thie. So this method ie practicable with advantage in thoee places where the ore is of low grade and fuel high.

The practical working of this process at the Ore Knoh mine, Ashe county, N. C., is thua described hy J. E. Clayton, in the *Scientific American*: "The ore to he treated was a copper pyritee of low grade, dressed to contain from 100 to 120 ponnde of oopper to the ton of 2,000 pounds; the gangue was a clay slate. Our mode of treatment was as follows: The ores were cruehed, sized by beiug pessed through a sieve of forty holes to the linear inch, and eent to the calcining furnacee. These furnacee were simple three-hearth reverberatories, and were charged every eight hours with 2,000 pounds of the prepared ore; the oharges, after being in the furnace for twenty-four hours, were withdrawn, weighed, assayed, and sent to the tenks. The calcination wae effected at a low red heat, with a view of converting ahout one third of the copper in the charge into sulphate; the remainder heing as oxidee, with the exception of from five to eeven and a half pounds to the ton remaining as unoxidized sulphnret.

The calcined ore was next charged into tanke of about 3,000 gallons' capacity, two thirde filled with bath, in weighed proportions of 3,000 pounds. The mixture was then agitated by a stirring apparatus connected with the tenk, and steam injected in sufficient quantity to raiso the temperature to abont 120° Fah. After eight hours stirring, the mixture was allowed to eubeide, the coppor eolution drawn off ioto eettling tauks, and about 600 gallons of weak hath drawn down upon the residues remeiuing in each stirring tank, to cleanee them of the copper liquor. This weak bath was then drawn off into tanks containing metallio iron, the copper precipiteted therefrom, and the liquid peseed into a reeervoir tank, to he again ueed in washing the residue from the following cherge. Tbe etirring tanke were then emptied and the residues wheeled away. The general averege of loss in theee resioues was from six to ten pounde of copper to the ton of ore treated.

The strong copper solution, after fully subsidiug in the eettliug tanks, was drawn into tanks containing irou (cast or wrought iron scrap), the copper precipitated, and the beth, with a small addition of salt, used in the treatment of a new charge of roasted ore.

After an experimental trial of a few months, we erected works equal to the treetment of the whole ore product of the mine. We, in the firet etart, prepared a given amount of hath, according to the inventore' formula, with copperae and ealt; and found in working the proceee that, hy celcining the ores at a low heat, avoiding a dead roeet, aud hringing from 25 to 33 per cent of copper into sulphate, the hath was eaeily kept at standerd etrength without the addition of any copperas whatever. The selt added was equal to twenty-five per cent., and the maximum of iron oousumed, to eeventy-five per cent. of the copper produced.

Our cost of making copper, obtainsd as cement, exclusive of mining and dreseing the ores, and not including the power required to work the stirring tanks, which wae merely nominal, wae, for producing 2,100 pounde of copper, from 21 tone of 5¼ per cent. ores, $76.96, equel to 3⅔ cents a pound.

The cost of the plant required ie small. The furnacee are simple and inexpeneive in construction, and require about 25,000 hricke each. The tanks cost, complete, aboot $60 each, and tbe lahor employed need not be skilled or high priced.

THE CHERRY CREEK mines continue to attract oonsiderable attention, but all the ground worth having is eaid to be located, as the new law gives every man 1,500 feet. The White Pine *News* in speaking of these mines saye: It is earnestly to he hoped that Cherry creek may exceed even the expectetions of the most sanguine, as in its development rests much of the success of the surrounding districts, such as Egan, Shellburo, Ruhy Hill, and numherlees others situatod east from us.

ALLEXEY VON SCHMIDT, the well known engineer, hes been appointed consulting engineer of the Mare Island Navy Yard, by Secretary Robeson.

The Proposed New System of Wharves For the City.

A bill has been prepared having in view the improvement of the water front of San Francisco, in accordance with the plan of T. J. Arnold, engineer of the Bulkhead. Mr. Arnold has prepared a statement of the reasons for the proposed changes. The bay, he states, covers an area of 257 square miles, reckoned to the line of high water, of which 79 square miles are within the three-fathom contour line, and navigable for sea-going vessels. The anchorage proper within the boundaries of San Francisco embraces an area of 39 square miles, and ships riding at anchor in its most exposed localities are seldom damaged by the most violent winter gales. The system of harbor works now in vogue is defective. A rectangular water front is established, which presents salient and re-entering angles to the current; the wharves are not parallel; the slips are too wide; the pier line is irregular, and the system is expensive to keep in repair. The Harbor Commissioners have expended in the last seven years the sum of $400,000 for dredging alone, and even then it is difficult to keep the slips open enough to allow large vessels to come alongside our wharves. The accumulation of sediment requiring this outlay is the result of the construction of wharves and bulkheads, without regard to their effect on the natural currents of the bay.

In view of the fact that our commerce is increasing so rapidly, some less expensive and more appropriate system should be adopted on our city front which will be best adapted to the physical character of the harbor. The present wharves, about thirty-three in number, are of all sizes, and built at all possible angles to the line of the water front, said line itself being nearly as irregular as it is possible to be. This renders it impossible to make use of it for railroad accommodation so as to bring ship and car together, for it is full of right angles, which it is impossible for railroad cars to turn; it is therefore necessary to alter it, and to make it as nearly as possible on curved lines, so that a railroad track or tracks may be laid along the entire length of the water front, and that the cars may be able to discharge their freightage easily into the vessels or storehouses ready to receive it. This irregularity, too, is the cause of a very heavy and onerous expense in the matter of dredging. The current of the tide as it ebbs and flows past the city front, forms eddies in the numerous angles and bays made by the wharves, and there are deposited the sand and mud carried along by the current. By the form of the proposed new line of water front this will be nearly altogether prevented, as the current will sweep unobstructedly along the entire city front.

We give herewith a diagram of the water front as proposed, omitting, however, the turnouts which will be constructed to admit of the cars being run out upon the wharves, and directly alongside the shipping.

To show the expensiveness of dredging under the present system, it may be remarked that the slip on one side of Market st. wharf, 650x70x25 feet deep at high water, cost in June, 1873, $9,777.36 for dredging. At present and under the present system, dredging costs more than all the other work on the city front together. Anything, therefore, that will lessen the expense will be a benefit to the city and State. And without the work is not done, for at the slips at the foot of Beale, Fremont and First streets, where there used to be 25 feet of water, there is now only enough for small vessels. The number of wharves now at which vessels can discharge is 33, having accommodation at one time for probably 40 first-class ships. Under the new system there would be 76 from the end of Stockton street to the end of Second, which would accommodate 152 vessels. Besides these wharves, there would be seven ferry slips. Some of the wharves under the present system are from 600 to 650 feet in length; under the proposed new one they would be all of a nearly uniform length. It does not propose extending the water front any further into the bay, but at some points would curtail it.

To sum up, the plan proposes to remodel the water line all the way from the foot of Van Ness avenue to the foot of Alvarado street, a distance of about 22,200 feet, or a little over four miles; to build wharves immediately from the foot of Stockton street to the foot of Second street, in conformity with the system, and as the business of the port demands increased wharf accommodation, ultimately to that of Van Ness avenue. The line on which the wharves are proposed immediately to be built is 13,800 feet in length, on which there is a bulkhead already constructed of 2,600 feet in length, which it is contemplated to make a portion of the remodeled water front. The proposed new line would be 2,600 or 2,700 feet less in length than the present, the distance saved resulting from the avoidance of angles. The wharves would all be about 300 feet in length with 140 feet between them, and would be all at right angles to the general direction of the currents of the bay. The railroad track would encircle the whole of it. It could be finished in five years from the time of commencing. And the cost of keeping in repair, dredging, etc., would not exceed that of dredging now.

The cost of the work is thus summarized: 1st—A stone embankment which will form a bulkhead, and at the same time serve as a foundation for a sea wall. 2d—A sufficient number of piers and slips to accommodate the commerce of the port. 3d—A sea wall of cut stone masonry. 4th—The paving of the street along the city front. The embankment will not entirely cease to settle for about five years after its completion, and at least that period of time must elapse before the construction of the sea wall and the paving of the street can be commenced. Indeed, it may be said, that while the latter work is necessary to make the improvement complete and permanent, it may for financial considerations be deferred until the growth of the city and the increase of business will warrant an expenditure for that purpose, which would now be a burdensome tax upon the people. It should also be stated that while the plan will, to a certain extent, designate the location of the wharves which will be required in the future, the number now constructed may be limited to the actual requirements of the business now transacted in the harbor.

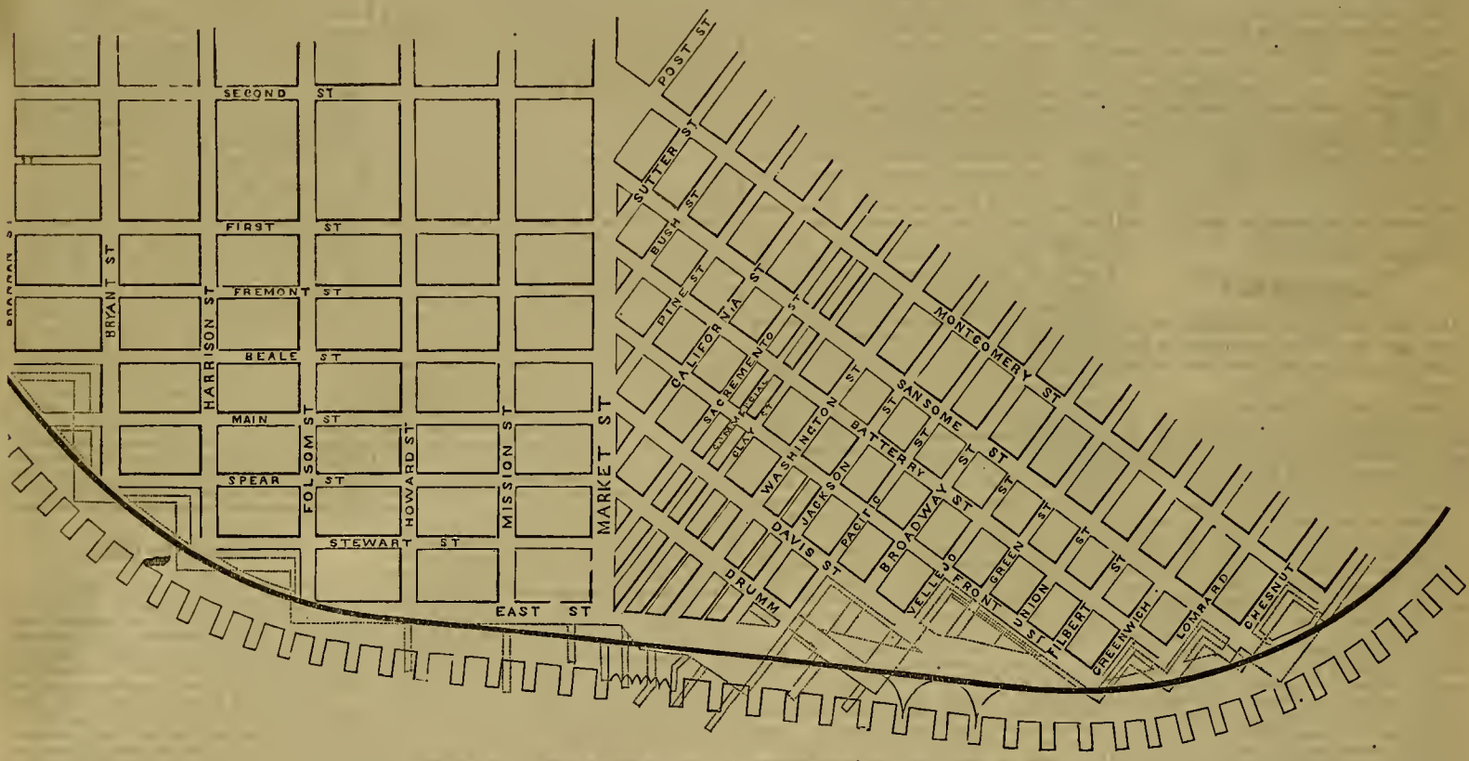
The cost per lineal foot of bulkhead and street, complete, is calculated at $398.65; and the estimated cost of a wharf, 350 feet long by 80 feet wide, is put down at $22,980, including the cost of bolts and spikes.

It is only considered necessary at present to improve the city front from the north line of Harrison street to the east line of Montgomery street, a distance of 7,800 feet. Within these limits a section of the bulkhead, 2,602 feet in length, has been completed. The above prices, applied to this section, give:

5,198 lineal feet of new work, at $398.65	$2,072,183
2,602 lineal feet of old work widened, at $282	733,764
15 new wharves, at $22,980	344,700
Removing old wharves and sewers and sewer connections	100,000
Total	$3,250,647

Omitting the sea wall and paving of the streets unnecessary in the meantime, the estimate would be $2,143,044; and by leaving East street, along the completed section of the bulkhead at its present width of 150 feet, a further saving of $361,678 could be effected, and the cost would then be $1,781,366. The outlay necessary to improve the city's half of the street is not included.

In conclusion we may say that this great work is a public necessity. We want increased accommodation for the large and daily increasing fleet of vessels that visit our port, and it is essentially necessary that ship and car should be brought together. Most of our commercial men who have examined into the matter, are in favor of the proposed system, and we hope that it will be inaugurated without any unnecessary delay.



PROPOSED NEW SYSTEM OF WHARVES ON THE WATER FRONT.

Patents for Simple Things.

In a recent application for a patent for an improvement in attaching metallic heels to boots, the invention consisted in extending the outsole the whole length of the boot and in fastening the heel upon such outsole. The application was rejected for the reason that it was not new to carry back the outsole as described, nor was the heel new; therefore the attachment of a heel to such sole was not an invention, though the ordinary method was to attach the heel to the insole, the outsole being only extended up to the heel. The applicant appealed to the Assistant Commissioner of Patents, who reversed the decision of the Board of Examiners, and held that, however small or insignificant an invention appeared, it ought to be patented if useful. In this case, the attachment of the heel the outsole made a firmer fastening for the heel, was better than the common plan, and therefore patentable. This is good doctrine; and if the Patent Office would only stick to it and carry it out into practice with uniformity, the interests of inventors would be greatly promoted. But, unfortunately, the decisions of the Patent Office are irregular. It too often denies on one day what it grants the next day. We cannot always rely upon the Office to issue patents for simple improvements, like roasted persimmon seeds, a knot upon the thread of an envelope, or, as in this case, nailing a heel upon the bottom of a boot. Yet it is for the issuing of patents upon just such simple improvements that 100 principal examiners and their 400 helpers are thought by some to be necessary.—*Sci. Am.*

Snow in San Francisco.

On Wednesday of this week we had our first regular storm of the winter and strangest of all to the residents of San Francisco, as were treated to a sight of snow on the surrounding hills. The lower part of the city and the hills back of us were covered for a short time with a light covering of snow, and Mount Diablo and the hills back of Oakland were similarly "whitewashed." The occurrence of snow is so rare in some parts of our State that the novelty was a welcome one. The "Pioneers" say we have had no snow before in San Francisco since 1856, a circumstance which people East will wonder at, especially as they have their peculiar ideas of "snow clad California." At Sacramento, oranges were hanging on the trees near the Capitol building while the snow fell. Vallejo, Suisun, Petaluma, San Leandro, Antioch, Oakland, Martinez, Gilroy, Napa, and many other places unaccustomed to see "beautiful snow" got a glimpse of it this time.

The unusual cold called out all the heavy overcoats available, and the old Californian who never wears such things winter or summer, began to think that the railroad had freighted over some of the Eastern climate. The storm was quite a severe one, but the rainfall will materially assist miners and farmers in their occupations. The highest velocity of the wind during the day was 28 miles. The records of Thomas Tennent show the quantity of rain which has fallen between July 1, and November 30, inclusive, each season the past twelve years: 1861, 4.12; 1862, 0.55; 1863, 2.58; 1864, 7.03; 1865, 4.69; 1866, 3.46; 1867, 3.65; 1868, 1.33; 1869, 2.60; 1870, 0.46; 1871, 3.86; 1872, 2.97, making an average of 3.10 inches for the twelve years. This year we had 2.17 inches for the same period. On December 2d, .04 of an inch of rain is recorded, giving a total of 2.21 inches for the season, previous to the present storm.

BOGUS.—The Denver *Tribune* has the following, which will be a warning to overland travelers: It is said that parties occasionally appear at the Union depot for the purpose of selling bogus silver bricks to passengers on the trains. Bricks not worth ten cents are sold for $4 and upward. Our informant, who is well acquainted with the smelting and assay business, saw a brick marked $16 sold, and pronounced it worthless.

EPIZOOTY AGAIN.—The *Record* says: The epizootic has again broken out among the horses in New York city, and nearly every car and stage line in the city has animals sick with it, in some cases deaths occurring in the harness. Great alarm is felt.

DEATH OF A PIONEER.—The Napa *Register* of the 24th inst. announces the death of Henry T. Barker, a pioneer of California and an old resident of Napa. He died suddenly on the 13th, while in his carriage, on the way from Vallejo to Benicia.

MARE ISLAND is to be supplied with water from Vallejo, by pipes under the straits.

The Salmon Breeding Enterprise.

We have several times mentioued the selmon breeding enterpriee on the McCloud River, Shaeta Co, Cal., under the superintendence of Livingstone Stone, and that it was attended with great success. In consideration of the difficulties real and apparent, connected with it, many of the fish culturiste in the east predicted a failure. The first lot shipped—300,000 in nnmher—all arrivod dead except 30,000, and the evil prediction appeared ahout to be verified. The last lot however, of 600,-000, came about 75 per cent. in good condition. The third lot arrived east in excellent condition, and the fourth and last lot better yet. In all, just about a million egge arrived at their destination alive. Mr. Stone's instructione from Washington, were to forward a million eggs, so, althongh some were lost, the enterpriee, as a whole, and in its reenlts, was almost an entire success.

The eggs were sent in larger or smaller lots ae follows:

Dr. J. H. Slack, New Jereey	475,000
Seth Green, New York	200,000
James Duffy, Pennsylvania	30,000
Geo. H. Jerome, Michigan	100,000
Cold Spring Trout Ponds, N. H	40,000
Chas. G. Atkins, Maine	10,000
Reh't. G. Pike, Connecticut	110,000
A. P. Rockwood, Utah	40,000
E. A. Bracket, Mass	30,000
Totsl	1,035,000

The New Jersey egge are intended for the Atlantic rivers hetween the Hudeon and the Jamee; the New York eggs for the tributaries of the Missiesippi; the Penneylvania for Pennsylvenia rivres; the Michigan for Lake Superior; the New Hampshire for the Connecticut river; the Utah for the Great Salt Lake, and the Maesachnsette for Maesachusetts rivers. It is proposed to continne work on the McCloud river next year if Congreee makee the necessary appropriation, which it is to he hoped it will. The question of an ahnndent supply of food fish ie an importent one and is juet beginning to be appreciated.

The Belcher Mine.

Our new cotemporery, the *Nevada Mining Review*, gives the following description of what ie going on in the famous Belcher mine on the Cometock:

Among the leading minee on the Comstock Lode there is none thet attracts more epecial notice and none that deserves more particnler conaideration then the Belcher. The perfection of its manipulation, and the regularity of ite resulte, placee it among the foremost of our treasure-bearing developments. Work ie now proeecnted on the incline at a depth of nearly 1,400 feet. Tne lowest point at which ore is taken out ie at the 1,300-foot level. The etopee at this point look well at a dietance of 230 feet from the Crown Point line. The body of ore hae been proepected a distance of about 400 feet. In the face of the drift working south, there ie excellent looking ore. From this level a winze ie being eunk to the 1,400-foot level, which is now down about 150 feet on a slope of about 35 degrees. At the south end, cross-cnte are being run 40 feet in width to he extended 332 feet. Stoping is continued on this level on the sill floor a dietance of 220 feet. The 1,200-foot level looks remarkebly well, ore of a high grade hoing in sight on either hand. It is stoped 205 feet on the floor, and the ore improvee ae the work ie extended eouth. At this point the ledge widene and shows the beet indications. On this level the winze ie down 92 feet, at a point 205 feet from the Crown Point line, iu very fine ore all of the way. On the 1,100-foot level there is hut little work doing, the ore being of a low grade. When the water snpply ie sufficient to warrant, the work will be vigoronely prosecuted. The ore now at hand will work from $25 to $30 to the ton. Preparations are making to teke this ore out on the 1,000-foot level. The ore still continuee of a high grade, ehowing a good amount of gold. Enough is exhibited at leest for a year's work. Prospecting ie conducted east and weet of the main vein, and cross-cute are heing run with meny rich indicatione. On this level a Burleigh drill is in use and works admirably. On the 1,300-foot level another drill is in nse which is worked by the compreesed air apparatus. On thie level is an engine, 7x12 cylinder, which ie ueed for sinking the winze.

The machinery and moving apparatus of this mine are of the moet complete character, and all of the appurtenances are arranged in the most systematic manner. The ore dump extends over the railroad at the east, and ie cepable of conteining 500 tons. From thie dump the ore is teken hy rail to the Eureka, Franklin, Vivien and Merrimeo mille. A douhle track rune from the mein line to the wood and lumher yard, so arranged that the wood for fuel ie deposited on one eide, and the timher for the mine on the other. Upon the ground at the sonth of the works there are deposited 8,000 cords of wood for fuel. The company have now on hand and in process of delivery over 7,000,000 feet of timber, all of which is ahout paid for. Within the space allotted to wood and timber there are four hydrants, each euppliod with an ample qnantity of carbolized hose to meet any emergenoy. The water comes from a large tenk on the side of the hill, and the hoee are capable of throwing, from natural preesure, a stream over 100 feet in hight. Every precantion ie teken that ingenuity can deviee to provide against accident. Dnplicate eheer wheels are upon the ground, each of which weighs from four to five tons. Adjoining the worke ie a epacious ice chest, containing ice for eech of the levels in separate compartments. The amount of ice consumed in this mine is enormous; three thousand dollars' worth being the monthly consumption. In the rope house is a duplicate eet of ropes, prepared for immediete use in case of emergency. Tanke of competent eize are provided, filled with tar, and the apparatue for covering the ropee is in every reepect the moet complete end convenient that we have ever seen. Adjoining is the hlacksmith shop, where there are three forgee in constant employment repairing machinery and toole.

The engine room is one of the heet arranged in the country, and conteins a 60-horse power pumping engine, 14x30 inchee, npon which gear is arranged which can be applied to a larger engine when necessity demands a change. It is now pumping 840 feet, and fnlly answere the requiremente of the mine. In the same apartment are duplicate compreseors that run an engine on the 1,300-foot level, which is ueed in einking winzes. They also operate the Burleigh drills. There are here two hlowers for carrying air through the mine. The incline engine is of 75-horse power, made at the Risdon Iron Worke; has 30-inch stroke, 20-inch cylinder. It is ueed for raising ore from the 1,300-foot level to the 850-foot level, where it is taken up by the second engine. Thie engine is so arranged thet by a duplicete apparatus one eet of reele will hoist while the other lowere the cage—both acting simultaneously. The third engine operatee circular saws in the cerpenter ehop, ae well as drilling machines. Its dimeneione are 12x28, and it is 40-horse power. In the carpenter ehop, adjoining the engine room to the south, are two circular saws 40 inches in diameter, used for cutting frames, wedges, etc.

Adjoining this apartment is a room containing a "Pond" drilling machine and a "Putnam" lathe, manufactured in Fitchburg, Mass. The lathe has a 30-inch swing and is of a 14-inch hed. Thie ie said to he one of the most perfect piecee of machinery on the Coast. It is ueed in making and repairing rings, pietons, and all other kinde of mechinery nsed at the worke. In the boiler room there are four sete of hoilere, six of which are in running order. Ordinarily three eets are run at once, two being kept in reeerve. These boilers are 16 feet hy 54 inches. There are four 8-inch Blake pnmps in connection to feed the hoilere. They are so arranged that in case of fire they can flood the entire worke. To eech 100 feet of carholized hoee are atteched, which renders thie the moet complete fire apparatus on the lode. Neer to the engine-room is a drying-room, provided for the minere, where their clothing is dried by meens of steam pipee from the exhauet. This building is two etories in hight and ie one of the most important conveniencee connected with the worke, ae it conducee greatly to the comfort of the operetives. Upon the north eide of the works is another hoiler-room, in which are two boilers ueed to cerry steam to every part of the esteblishment, as well as to run the compressore aud pumping engine. The six hoilers used in the hoisting works conenme 15 cords of wood in 24 hours on an average.

Upon the top of all the buildings are water tanke, eo that together with the fire apparatus before alluded to, a conflagration upon the premises ie almoet an impoesibility. Work is now progreesing on the 900, 1,000, 1,100 and 1,200-foot levels, with varying reeults. The reeult of this lahor is that the mine is sending ore to the mills for reduction at the rate of 500 tons per day. There are at work on the mine, mechenice included, from 500 to 600 men per day, at an expense, as per pay roll, of $75,000 to $80,000 per month. Since the opening of the mine, twenty dividends have been paid, amounting to $82 to the share, or in the aggregate, $8,-528,000. The general appearance of the mine maintains its former repute, and the prospecte for the future are very flattering, especially on the 1,300-foot level. Upon this development in a great measure the future euccess of the mine depends. From present indicatione there cannot be the slightest douht bnt that the Belcher will continue to be a dividend-paying mine for a number of yeers to come. Well may this mine be denominated the King of the Cometock Lode. Since August, 1871, this mine has produced in hullion $14,731,846.81. From Auguet, 1871, to December, 1872, the gross proceeds of the mine were $5,992,545.97. During the paet ten months of this yeer the mine has produced $8,639,300.84. With such a ehowing, who cen douht the stebility of this mine? The report of 1872 shows that during the year 33,195 tone of ore were milled, yielding $4,794,659.10 in hullion, or an average of $57.63 per ton, at a cost of 21.07 per ton. A more detailed sketch of this mine would he of interest, but we regret that we have not the epace to carry the euhject further. Enough has been shown to demonstrate that the Belcher ie yet to be depended on.

Baltimore is prohahly the greatest fruit-packing market in the world. There are millions of dollars invested in the hueinese, and many thousand bushels of peachee are canned every year. One firm ie eaid to pack 25,000 cans per day.

Arrangemente are heing made to increase the capaoity of the Carson Mint for coining silver.

Cost of Materials in Various Manufactures.

Or rather, the valne of the former to the lattcr, in the different ludustries differs very much. In some, the lahor reqnired is comparatively little, and, of course the value of material hears a very large proportion to that of production. In others, the lahor used is the chief item in the manufacture, and the materials hear a much smaller proportion in value to that of the product than in the former case. In the manufactures of iron and steel, taken as a whole, the value of msterial is fifty per cent. that of production. In lead refining and manufacture of lead, the proportion rises to sixty-six per cent.; in thoee of gold and eilver, the proportion is fifty per cent.; in those of hrass and mixed metals, the proportion is extremely small, not more than fifteen per cent., or the msterials, when manufactured, average six times the value of the metels used; the proportion of material to manufacture in tinware is only thirty-three per cent.; in lumber, even less, heing only a little over twenty-five per cent.; in manufacture of leather, about thirty-one per cent.; in textile fshrics, it rises to sixty-six per cent.; in malt and spirituous liquore, it is about the same; in articles of food, it ie fifty-seven per cent.; in printing and newspaper puhlishing, it is thirty per cent., though of course it varies extremely in particular instances; where only a smsll newspaper circulation is kept up the valne of material is far less, proportionately, than where it is large. In manufactures of animal products the value of material rises to ss much as eighty per cent; and for the halance of the manufactured goods not included under any of the above headings, it may he roughly stated as fifty per cent. In all these departments there is in the various articles composing them almost as much variation in the proportion of materisl to product as there is in the departments themselves. For instance, where the value of the pig-iron is ahout half of the vslue of the csstings made; the value of steel, etc. used in the manufacture of cutlery is only about thirteen per cent.; and that used in saw-making ahout eighteen per cent.; whereas the iron used in screw-holts forms nearly seventy per cent. of the valne of those manufactured. In jewelry the material costs about sixty per cent.; hut in silverware only about thirty-two per cent., and in silver-plating as small a proportion. The makers of gold pens do not run much risk in addition to their lahor, for they sell the pene at four times the cost of the material used. In works in hrass, etc., the contrast is presented of hrass-fittings in general hringing eight times the cost ot the metals used; while in msking gas-fixtures the value of the material rises to 33 per cent.

The general average of material to production in lumher, is rather small on the whole. In the furniture manufacture, it is about twenty-one per cent.; in the carriage industry it is ahout thirty-three per cent. Doors and sashes have ahout the same proportion of material to manufacture; in packing hoxes it is larger and forms nearly one-half of the total value of the product; the material used in making picture frsmes costs ahout as much as one-half of their whole subsequent valne; that used in cooperage, dwindles down to twenty-five per cent.; the material that enters into matches, matchwood, records of the arrival of a few cords of which may he seen now and then, is positively the cheapest of all, not heing over nine per cent. of the article when finished. The material, lumher, lron and leather, used in trunk making, usually costs ahout thirty-five per cent. of the value of production; the material of hilliard tahles ahout twenty-five per cent.; that of wood ware, fifteen per cent.; that of cigar hoxes ahout thirty-three per cent.; and the lumher that goes into the harrels and kegs is about fifty per cent. of value. The stslr makers only put in twenty per cent. of material, hut the hrueh makers, more llheral, give fifty per cent. worth; of the pianos made here, ahont thirty-seven per cent. of the value is spent in material. In the manufacture of hoots and shoes, the Crlspin puts in thirty-three per cent. of raw material; in saddlery, there is put in nearly forty per cent. of leather in the saddles they make, that is to say, the utmost value of the material used; the collar makers put in thirty-five per cent., and the makers of hose and helting, not less than sixty-six and two-thirds per cent.

In our woolen manufactures, ahout the same amount of percentsge ie added to cost of material. In the articles of men's clothing, made in factories of more or less size, or hy the Chinese, the material usually forms ahout one-third part; of white goods, about one-half; those glossy hats that our responsible men so much delight in, about eighty per cent.; of manufactured furs, one-half; of shirte nearly so; do of umbrellas and parasols; of huckskin gloves, the material is worth a third of the wholesale price; of army and military caps, sixty per cent.; of straw goods, not more than twenty-five per cent.; of clothing, thirty-seven per cent.; of kid gloves (made from dog skin), thirty-three per cent., and of necktiee, the smallest of all, six per cent.

In the value of refined sugars, that of the raw sugar is ahout fifty per cent., hut if we take into account the syrup product, it is somewhat less. Flour is one of those articles in which the value of the material used up, approximates pretty nearly to that which is made from it, it heing ahout eighty per cent. Out of the value of preserved fruits, meats. etc., we may count one-half as that of the fruit itself; pork and heef when packed, receive an increase of value of one-third when smoked, etc., and the preparation of raw coffee and spices for domestic use, adds one-half to their value. In candles, it is ahout the same, hut the flour which is used in ship hread is doubled in value hy the operation, as also is the crude Bay salt. Manufactured mustard is just six times the value of the unprepared article, a very striking discrepancy hetween material and production. The raw material of vinegar ie trehled in price hy manufacture, while that of msccaroni is increased hut fifty per cent.

One-half of the value of the manufactured chocolate is expended in the purchase of material. Something less than one-third the whole value of the newspapers of the city is spent for material; something more than one-third for general printing; while in lithography the material used costs about twenty-five per cent. In the manufacture of cigare,—the great stronghold of Chinese lahor in this city,—the material forms ahout forty-two per cent. of the market value of the cigars. The proportion of the msterial is very large in oatmeal, ground rice, etc., heing about eighty per cent. In the manufacture of linseed oil, etc., the proportion is nearly as great. In upholstery and hedding it is not more than half this, or not over forty per cent. The raw material of chemicals, out of which are evolved the acids, etc. that we use and export, is a little more than doubled in value hy the manipulation of the skilled workman. In hag making, the quantity and value of the raw material seems to leave a much smaller margin to the manufacturer than almoet any other industry, the material actually forming in value eighty four per cent. of the selling price.

The manufacturers of Hercules and dynamite powder leave a good margin for profits—ahout fifty per cent. The marhlemen, those who furnish to order those outward and visihle monumonts of woe, spend about thirty-one per cent. of the price they charge the customer in the purchase of the unhewn marhle on which they exercise their funeral skill. The druggiste are a little hetter for they spend forty out of every hundred cents in the purchase of the preparations which they pnt up in the compounds destined to help us along on the road to the hetter and a purer world. The ink-makers get fifty per cent. advance on the coet of the mysterions compounds from which they prepare it. The hookhinders however, are not so cousiderate, for they charge just five times what they pay for paper, twine, and sheepskin. The glasshlowers evidently know what they are about when they pay 22 cents for what they afterwards charge 50 for. The preparers of Eureka hair charge us thirty three cents on every dollar for their lahor.

In artificial stone the ingredients form sixty-six per cent. of the value, when ready for uee in hnilding. Broom corn costs, perhaps, sbont 40 per cent. of the valne of the hrooms when made. Almost the same proportion holds good in cement pipe. Smoking tohacco puts on two-thirds of its value in the process of manufacture, at least, what is made in this city does. So does oil in that of refining, hut paints and varnishes are only charged at wholesale, fifty per cent. above the cost of the material. The process for the preservation of wood adds fifty-five per cent to its value. The refining of horax adds fifty per cent. to its value, hut as the quantity is lessened as the quality is increased, the advantage to the manufacturer is not so obvious. The maker of plaster ornaments charges six-hundred per cent. for the use of his time, and thst of his workmen. Fireworks cost only twenty-five per cent. of the price at which they are sold, for powder, etc. In mirror silvering carried on hy only one house in this city, the materials cost ahout sixty per cent. of the value of the articles when finished. In glass cutting and stalning the labor and skill employed ie so great that the value of material is not over twenty per cent. Brickmakere have the difference that is hetween forty and a hundred cents, to pay for their lahor and that of the men.

In the manufacture of block pavement the value of material is about forty per cent of that of production. In the manufacture of fuse the proportion is eixty-five per cent, and that of trusses it is less than fifty per cent., and in that of willow ware less than thirty-three per cent. Those who manufacture artificial flowers and regalia in a small way use a correspondingly small amount of material, hut they have to make their own living as well as that of their workpeople out of it.

Newspapers show only a comparatively small expenditure for psper and ink on the value of the paper when sold, not more than thirty-three per cent.; hut lest those who read newspapers should think that their proprietors had too much of a good thing we may say that lahor, hoth mental and physical, eate up hy much the larger proportion of the remaining two thirds. The number of printers and printers' dcvils fonnd in even a small newspaper office would surprise the uninitiated. The proportion of material in ordinary printing is somewhat larger, this is of course accounted for hy the fact that the immense circulation of some of our newspapers, (and therein, although it may not he esteemed very modest of us, we include ourselves), the cost of material proportionately to the whole is reduced to a minimum. In lithographing, too, the proportion of material used is small, the labor heing the principal element in that business.

With the workers in iron and steel, we find that they are paid a fraction over one-third of the valne of the goods they manufacture. This leaves hut a small margin for the owners of the establishments concerned in this industry. This ie the general result, hut it is very different in particular cases. This is the proportion of the foundries, hut in the rolling-mill, wages form only twenty-five per cent. of production, and the profits are ahead of the wages of lahor. In the manufacture of wire rope for ships' rigging, mining purposes, etc., the proportion of wages is still further diminished and that of profit still further increased, the former heing only 12½ per cent., while the latter is nearly douhle. In the manufacture of saws, lahor is on sixty per cent. of the total value of the product, while the profit is not more than twenty. In the manufacture of Bed Springs, lahor forms about ten per cent. of the whole value, and profit about twenty, hnt to lahor in this case should he properly added the value of that of the proprietors.

In the manufacture of Cutlery labor makes about 44 per cent. of the value of the whole and the profits of capital about 62 per cent. In that of Screw Bolts, lahor is 25 per cent., while capital has not ½ per cent. In the manufacture of tools, each is represented hy about 40 per cent. In Wire Goods, lahor has hitherto formed 50 per cent. of the whole value; capital has had a very small percentage. In that of Electrical Instruments, labor has had 45 per cent. and capital 15. The Carriage Spring makers have about 33 per cent., while the employees have about 25 per cent. In Lead refining about a tenth part of the value of the production is paid in wages, while a fourth goes to the proprietary. Gold and Silverware pays 14 per cent. to the workman and 33 to the employers. Brass founding seems to be profitable, for, whereas only thirteen per cent. of the market value of products is paid to the mechanics employed, capital receives 50. In the manufacture of Lumher, lahor is paid 35 per cent. or nearly, and capital 33, a much hetter showing than is offered hy the Iron industries.

Giant Powder for Fishing.

Our correspondent who aeked regarding the use of giant powder a couple of weeks since, seem to fear that it would he so frequently employed as to deprive the watere of our beautiful mountain lakes and rivere of fieh. There ie little danger. Those who have witneesed its explosive force describe ite power ae terrific.

It ie composed of a yellowieh earth, eaturated with nitro-glycerine. The explosion, therefore, ie no more or lese than explosion of nitro-glycerine. The preesure of numberlese tone of water has no more effect upon its power, apparently, than the atmosphere hes upon ordinary gun-powder. A thousand little flashes of light ehoot out in every direction from the cherge with the swiftnese of electricity, the whole boeom of the lake trembles with the shock, and a hnndred tons of water rise up bodily from the eurface.

The report is a weird, ehuddering, indescribable species of thunder, that rings in one's ears for weeks. Now, from the very neture of the suhstance, it ie extremely dangeroue, even in the hands of the most careful. Theoretically, it cannot be exploded except by the peculiar cap that ie prepared expresely for the purpose. Bnt, in epite of the theory, it eometimes explodes without a cep. The nitro-glycerine sometimes oozee from the earth with which it is mixed, and collects in or about the paper that is wrapped about the charge of giant powder.

Under these circumstancee it is no safer than genuine nitro-glycerine. The explosions are eo powerful as to exceed all belief. Explode a piece of the powder no lerger than a pea upon an inch hoard, and the hoard will be ehattered into fragmente. It ie eo little nnderstood, even hy scientific men, that no rules cen be laid down for ite use. When it is accidentally discherged, scientists are rendered none the wiser, hecauee no one is left alive to explain the manner in which it exploded.

Very few men are competent to nse it with even a moderate degree of safety, and every men who experimente with it feele that he ie risking hie life. To be sure it kills fieh. It is an instantaneous, unmerciful way of elaughtering every fish, he it large or small, within a radius of 30 feet. But the very euccese which attends the experiment, makes e man ehudder with horror, and this, together with the terror of en accidental explosion, and the fear of the rigorous hand of the law if discovered, will, to to a great extent, deter men from following this mode of fishing.—*Truckee Republican.*

Narcotics and Stimulants.

We had occasion, last year, to notice the third annual report of the Massachsetts Board of Health, prepared by the Chairman of the Board, Henry I. Bowditch, in which the question of "Stimulants" was discussed at considerable length. As the matter seems to possess a renewed interest at the present time, we reproduce the article which we then published:

Correspondence bearing on the question of stimulants had been solicited from persons at fifty-three widely separsted points upon the earth's surface, including each of the leading or more popular nations. Many of these were the Ministers and Cousnls of our Government. In analyizing these the Board states its own conclusions, which are to the effect that the appetite for stimnlants is universal; that its gratification may be curbed within healthy limits by the spresd of more intelligent views of the kinds of stimulants that ought to be used, and the circumstances under which, and extent to which, they may be used; that in hot countries or hot weather the use of alcohol is nnnatural, and should be avoided, while the "nervines"—tea, coffee, opium, hasheesh and the like—are, and shonld be substitnted.

The cultivation of the vine, and the free nse of wines, and the use of ale are the influences which, on a large scale, tend most to diminish intoxication, and, especially, to lessen the crazy form of intemperance, by substituting liquors that admit of but little adulteration, and which satisfy the appetite long before they intoxicate, for those of which the smallest draught tends to intoxicate, and which tempt to vile adulterations that eraze the brain even more than alcohol.

The southern and wine producing countries of Europe have much less crime as the result of alcohol than the colder and more changeable climates of northern Europe and the United States, which drink ardent spirits that sre from 50 to 60 per cent. alcohol; that all public bara for the sale of spirits shonld be suppressed, while those for the sale of ales and wines should be permitted; that the growth of native wines should be encouraged, and the duties on foreign light wines removed, so that the kinds of wine which are favorable to health may be cheap and abundant; those that narcotize by the use of small quantities should be sold only as poisons by druggists, on the prescriptions of physicians; drnnkenness and not the sale of liqnor should be punished as a crime; bnt, where liquor is sold so as to prodnce drunkenness, the seller should be obliged to support the drunkard and his family for some specified time.

Dipsomania—the depraved and uncontrollable thirst for drink—should be treated by confinement in State Inebriate Asylums, of which three or four are needed for the State of Massachusetts, after many years of experiment in the prohibitory line. It is not a little remarkable that the views of medical men and scientific investigators generally, are not only in very general accord with each other, bnt are in conflict, equally, with the course of legislation, the views of philanthropists, and the customs of American society.—*Chicago Tribune.*

MINING DECISION.—Dispatches from Washington state that the Secretary of the Interior has decided the case of the Eureka Mining Company vs. the Jenny Lind Mining Company, and others. He held, in accordance with the advices of Assistant Attorney-General Smith, first, that in regard to estimating the sixty days of publication required by the Act of May 10th, 1872, the first day of publication shonld be excluded and the last included; second, that the jurate to adverse claim, required by the seventh Section of the said Act, mnst be made by the Attorney; third, that where several persons unite in adverse claim, the jurate is sufficient if made by one of such persons; fourth, that the filing of an adverse claim in the register of the local offices is sufficient filing under such Act, and, fifth, that the adverse claim of the Jenny Lind Oompany has sufficiently set forth the natnre of the said claims, and the decision is, therefore, in favor of the Jenny Lind Company, as against all other adverse claimants.

PLATINUM BRONZE.—It is well-known that all alloys containing copper, even in minute proportions, are readily acted on by acids, which makes them dangerous when nsed for honsehold utensils. M. Helouis has proposed an alloy, under the name of platinum bronze, which is entirely inoxidizable. It is a nickel alloy, prepared from nickel made thoroughly pure by various processes and maceration in concentrated nitric acid. The proportions employed are nickel 100, tin 10, and platinum1—the two latter metals being added to the fused nickel in the proportion of 4 of tin to 1 of platinum, and the remaining 6 parts of tin added subsequently. For bells and sonorous articles, the proportions aro slightly varied, viz: nickel 100, tin 20, silver 2, and platinum 1.

AN IMPORTANT AND CHEAP SOUNOE OF POTASH. Dr. Herbert Hazard suggests the use of corn cobs for supplying potash, the ordinary sonrces of which are rapidly failing. He states that the average yield of corn-cob is 7.62 parts of carbonate of potash in 1,000 parts of the cobs, which is nearly twice as much as the best specimens of wood will furnish. The present corn crop of this country will supply 15,400,000,000 pounds of cobs, from which 115,500,000 pounds of potash could easily be manufactured The question hinges npon the process Mr. Hazard would employ for extracting the potash, however.

DEWEY & CO.,

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

The best, speediest, and surest method for you to obtain patents, file cavents, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents ou this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors. We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, hut with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain Patent,

well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address npon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & Co., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send $15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

Address DEWEY & CO.,
PUBLISHERS, PATENT AGENTS AND ENGRAVERS,
No. 338 Montgomery street, S. F.

ATLANTA, Alturas Co., Idaho Territory, Oct. 28, 1873. Messrs. DEWEY & Co.—Sirs: We hereby acknowledge the receipt of our Letters Patent (wire way) by Wells, Fargo & Co. We are well pleased and perfectly satisfied with what you have charged, and we also tender you our thanks for obtaining the patent for us in so short a time. Yours respectfully, H. T. LANTIS & NELSON DAVIS.

Laws Concerning Corporations.

[Under the New Code—January 1, 1873.]

GENERAL PROVISIONS APPLICABLE TO ALL CORPORATIONS.
WAGON ROAD CORPORATIONS.
WATER AND CANAL CORPORATIONS.
HOMESTEAD CORPORATIONS.
MINING CORPORATIONS.
LAND AND BUILDING CORPORATIONS
ALSO, MINING PARTNERSHIP LAW.

A pamphlet containing the above provisions concerning Corporations has been printed from the Statutes of California. It furnishes those who wish these special laws an opportunity of obtaining them for the small sum of 25 cents (post paid). Address, DEWEY & Co., Publishers, and Patent Agents, S. F.

A Good Bindsr for $1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) nsed continuously for subsequent volumes. Post paid, 25 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the PRESS. 1amhp

Wilson's coal mine, near Lincoln, has started up, the hoisting works having been completed.

Parks & Bowie's tailings mill in Seven Mile cañon has temporarily shut down.

The Most Popular Medicine Extant.

1840. Over 30 Years, 1873.

SINCE THE INTRODUCTION OF

PERRY DAVIS'

PAIN-KILL R,

And after thirty years' trial, the "PAIN-KILLER" may justly be styled the great medicine of the world, for there is no region of the globe into which it has not found its way, and none where it has not been largely and highly prized. Moreover, there is no climate to which it has not proved itself to be well adapted for the cure of considerable variety of diseases; it is admirably suited for every race. It has lost none of its good name by repeated trials, but continues to occupy a prominent position in every medicine chest; and is still receiving the most unqualified testimonials to its virtues from persons of the highest character and responsibility. Physicians of the first respectability recommend it as a most effectual preparation for the extinction of pain. It is not only the best remedy ever known for Bruises, Cuts, Burns, etc., but for Dysentery or Cholera, or any sort of bowel complaint, it is a remedy unsurpassed for efficiency and rapidity of action. In the great cities of India and other hot climates, it has become the Standard Medicine for all such complaints, as well as for Dyspepsia, Liver Complaints, and other kindred disorders. For Coughs and Colds, Canker, Asthma, and Rheumatic difficulties, it has been proved by the most abundant and convincing testimony to be an invaluable medicine. No article ever attained such unbounded popularity. As an external and internal medicine the Pain-Killer stands unrivalled.

Thirty Years are certainly a long enough time to prove the efficiency of any medicine, and that the PAIN-KILLER is deserving of all its proprietors claim for it, is amply proved by the unparalleled popularity it has attained. It is a SURE and EFFECTIVE remedy. It is sold in almost every country in the world, and is becoming more and more popular every year. Its healing properties have been fully tested, all over the world, and it needs only to be known to be prized. Be sure you buy none but the genuine, manufactured by PERRY DAVIS & SON, Providence, R. I.

Sold by all Druggists. nov8

The Mining & Scientific Press

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Every Miner, Assayer, Millman, and Metallurgist in the United States should take it.

Every Pacific Coast Mechanic, Engineer, Inventor, Manufacturer, Professional Man, and Progressive and Industrial Student should patronize its columns of fresh and valuable information.

Every Mining Engineer, Superintendent, Metallurgist, Mine Owner and Mine Worker in the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Every intelligent thinker in the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

DEWEY & CO.,

AGENTS WANTED to canvass every town on the Pacific Coast for the MINING AND SCIENTIFIC PRESS, PACIFIC RURAL PRESS, and the ILLUSTRATED PRESS. Experienced canvassers preferred. Good men can make large wages, besides learning much and improving their talents.

And in accordance with law, and an order of the Board of Trustees made on the twenty-seventh day of October, 1873, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the Company, Room No. 12 Express Building San Francisco, California, on Wednesday the twenty-fourth day of December, 1873, at the hour of 12 M., of said day, to pay delinquent assessments thereon, together with costs of advertising and expenses of the sale.

O. J. EATON, Secretary.

Office, Room No. 12, Express Building, San Francisco, California.

Land Purchasers Association—Office, No.

425 Kearny street, San Francisco, Cal.

Notice is hereby given, that at a meeting of the Directors, or Trustees of this corporation, held on the 19th day of November, 1873, an assessment of ten dollars per share (being the 28th monthly installment on the subscription to the stock) was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, the Secretary, at No. 425 Kearny street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 22d day of December, 1873, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the 13th day of January, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

O. S. WRIGHT, Secretary.

Office, No. 425 Kearny street, San Francisco, California.

Mina Rica Mining Company—Office of the

Mina Rica Mining Company, No. 320 California Street, Room No. 5, San Francisco, California. San Francisco, Nov. 26th, 1873.

In accordance with a resolution adopted at a meeting of the Board of Trustees of the Mina Rica Mining Company, held this day, a special meeting of the Stockholders of said Company is hereby called; the same to be held at the office of the Company, No. 320 California street, Room No. 5, San Francisco, California, on Monday, the 20th day of December, 1873, at two o'clock P. M., of said day, to take into consideration and decide upon the proposition to increase the Capital Stock of said Company, from one million dollars, ($1,000,000) divided into ten thousand shares, of the par value of one hundred (100) dollars each, the present Capital Stock, to Two Million ($2,000,000) Dollars, divided into twenty thousand (20,000) shares, of the par value of one hundred (100) dollars each.

C. F. GIFFIN,
J. H. H. WILLIAMS, } Trustees.

Moreau Machine Manufacturing Company.

Principal place of business, San Francisco, California.

Notice is hereby given that at a meeting of the Directors of said company, held on the third day of December, 1873, an assessment (No. 1) of fifty cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, No. 304 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Saturday, the 17th day of January, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the ninth day of February, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. B. ISAACS, Secretary.

Office, 304 Pine street, San Francisco, Cal. de6

North San Francisco Homestead and

Railroad Association—Principal place of business, City and County of San Francisco, State of California. Location of works, City and County of San Francisco, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 1st day of December, 1873, an assessment of Two Dollars per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at his office, 314 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3d day of January, 1874, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 26th day of January, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of the sale.

A. D. SMITH, Secretary.

Office, 314 California street, San Francisco, Cal.

Ophir Copper, Silver and Gold Mining

Company—Location of works, Ophir, Placer County, State of California. Principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of November, 1873, an assessment of Ten Cents per share was levied upon the capital stock of the Corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room 4, Duncan's Building, 411½ California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of December, 1873, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the 5th day of January, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

O. H. BOGART, Secretary.

Office, No. 411½ California street, San Francisco, California. no15

Ohio Consolidated Gold Mining Company.

Machinery.

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydranlic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PRGMPTLY PRGSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

7v25-tf JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Opsrates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces,—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

Nevada Metallurgical Works,

21 First street.....San Francisco.

Ores worked by any process.

SAN FRANCISCO METAL MARKET.

WEDNESDAY M., Dec. 3, 1873.

There are no important changes to note in the Metal market. Business is fair, as building and machine construction absorb large quantities steadily. A large user complains that Iron of the finer descriptions, and more especially Steel, is not shipped hither in larger amounts. He states that from this cause our constructors are obliged to make machinery much more bulky than would be necessary with better material. So, then, our shops are not to blame in this respect. It is a point most easily noticed by a superficial critic. Quicksilver is steady at $1.10.

LEATHER MARKET.

[Reported for the PRESS by Dolliver & Bro.]

WEDNESDAY, M., Dec. 3, 1873.

The Leather market is quiet. In the Atlantic States business in this line has been very dull, and is much depressed at present. The local market is not injuriously affected. Sheep Linings and French Kips are called for. Very little or no Wax Leather is to be had. Cornellian Females hold the advance lately noted and are strong at quotations given.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., December 2d, 1873.

FOR WEEK ENDING Nov. 18TH, 1873.*

INGOT MOULD.—Johu Feix, S. F., Cal.

TAP, PLUG AND FAUCET.—John F. Kane, assignor of one-half interest to Samuel Guthrie, S. F., Cal.

BLACKBOABD RUBBER.—Pemberton B. Horton, S. F., Cal.

ORE-STAMP FEEDER.—James Tullock, Jamestown, Cal.

PAVEMENT.—W. H. De Valin, Sacramento, Cal.

TREATING BRICK FOR PAVEMENTS.—W. H. De Valin, San Rafael, Cal.

REISSUE.

WINDMILL.—Attwood & Bodwell, S. F., Cal.

———

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

DEWEY & CO.,

American and Foreign

Patent Agents.

No. 338 Montgomery St.,

SAN FRANCISCO.

Patents Obtained Promptly.
Caveats Filed Expeditionsly.
Patent Reissnes Taken Out.
Patents Secured in Foreign Lands.
Assignments Made and Recorded in Legal Form.
Copies of Patents and Assignments Procured.
Examinations of Patents made here and at Washington.
Examinations made of Assignments Recorded in Washington.
Examinations Ordered and Reported by TELEGRAPH.
Interferences Prosecuted.
Opinions Rendered regarding the Validity of Patents and Assignments.
Rejected Cases taken np and Patents Obtained.
Every Legitimate Branch of Patent Agency Bnsiness promptly and thoronghly condncted.
SEND FOR CIRCULAR.

SEALS MADE TO ORDER

FOR FRATERNAL SOCIETIES,

Publishers and Engravers.

A NEW BOOK ON MINING.

SECONN EDITION—BEVISED AND ENLARGED.

The Explorers', Miners' and Metallurgist's Companion; Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy. The Most Practical and Comprehensive Work on Mining Subjects Extant. Comprising 672 Pages, and 83 Engravings. By J. S. Phillips, M. E. Price, bound in cloth, $10.50; in leather, $12 (currency). Forwarded by mail for 50c. extra. For sale by DEWEY & Co., Patent Agents and Publishers Mining and Scientific Press, S. F.

GIANT POWDER.

Patented May 26d, 1868.

THE ONLY SAFE BLASTING POWDER IN USE.

GIANT POWDER, NO. 1,

For hard and wet Rock, Iron, Copper, etc., and Submarine Blasting.

GIANT POWDER, NO. 2,

For medium and seamy Rock, Lime, Marble, Sulphur, Coal, Pipe Clay and Gravel Bank Blasting, Wood, etc.

Its EXCLUSIVE use saves from 30 to 60 per cent. in expenses, besides doing the work in half the time required for black powder.

☞ The only Blasting Powder used in Europe and the Eastern States.

BANDMANN, NIELSEN & CO.,
General gents, No. 210 Front Street.

At the lowest Market Prices.

HALLIDIE'S

Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN—My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Frelhurg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear ont. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial npon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, O. C. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO., Little Cottonwood, Utan.
Superintendent's Office, Sept. 23, 1872.

T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in epicndid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 904.

A. S. HALLIDIE, Patentee,
113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE 113 and 115 Pine St.

SAN FRANCISCO, SATURDAY, DECEMBER 13, 1873.

VOLUME XXVII. Number 24.

The Cuyamaca Grant Decision.

The Commissioner of the General Land Office last week rendered a decision in the Cuyamaca grant case, rejecting Pascoe's survey of the ranch, which is in San Diego county. The Commissioner has issued orders to the Surveyor General to run the north line along the northern Cuyamaca peak, which will exclude Julian City and the mines from the new official Survey. The decision was a most righteous one and may be accepted as a final settlement of the suit in favor of the settlers. On receipt of the news the miners of Julian held a grand celebration, torchlight procession, and general rejoicing. The ranch was owned by John Treat, Jnan M. Luco and Isaac Hartman. During the celebration the miners tried, convicted, hanged, and burnt the first named in effigy, which showed their feelings in the matter.

This "grant case" is but a type of many preceding it. The owners tried to "float" their grant over the mines, so as to include them in the survey, and thus become possessors of property discovered and developed by others. Previous to the discovery of the mines, in 1870, no official survey of the ranch had been made, but the owners had claimed all the timber and pasture-land available, and were running a saw-mill and grazing their cattle there. After the mines were found, they became anxious to run their lines so as to include them. A survey was made by one Pascoe, which just suited the owners of the grant, as the mines were taken in. Pascoe would have fared badly at the time, if the attorney for the miners had not advised peaceful measures, being sure of winning the cause in the end. The survey was contested by the miners, in Washington, with the result as stated above.

Ever since this suit was instituted the owners of the grant, all rich men, have been doing their level best to discourage and annoy the miners. They instituted suit to restrain waste of timber and to prevent waste upon the land. The best joke in this connection is that the town was built up of lumber bought from the owners of the grant, as they owned the saw-mill. The complaint in the suit avers that "without color or right, the miners laid out a town known as Julian City, containing some 600 inhabitants, that was built principally of lumber taken from the ground owned by the owners of the grant." A new mill was put up a year or so ago which did cut lumber, but most of the town was built before this mill was erected.

The decision of the Commissioner, however, "knocks" that suit, and the "grant men" will have to "haul in their horns." The thing was a swindle from the beginning — a mere land-grabbing scheme. The ranch was bought on a speculation, and the owners thought that they could do as the owners of the San Felipe ranch, adjoining, had done; that is, extend their boundaries, take in all the good land, and thereby practically control four times as much land as the grant called for. The thing is so common in this State that Messrs. Treat & Luco *et al.* are doubtless surprised at being beaten; but of course, if proper measures had not been taken by the miners, the case would not have received the attention it has, and the decision would, perhaps, have been different.

We rejoice to know that in this instance, at least, the miners have their just rights and the land grabbers have had a "set back. Both Julian and Banner districts are making a good showing and some of the mines there are valuable. A permanent population of miners and small farmers have located in the vicinity and these ranch men wanted the place as a cattle range. Having the most money they felt sure of their game, but, for once, made a failure of it. The country adjacent to the mines is, without doubt, the best in San Diego county, as they have plenty of rain and plenty of timber and grass. During the past three years this grant question has been hanging over the miners, and they have been unable on that account to get capital to aid them develop their property, as the title was imperfect. This decision will give them a chance to work in earnest and enable them to solicit assistance from capital with some show of getting it.

SAN JUAN.—The Colorado papers state that the rush for San Juan has fairly started. Hundreds are on their way and hundreds about to go. It will have one good effect at least, as it will cause easier times in the old camps with high wages and plenty to do. We think the prospectors in the San Juan country this winter will have their hands full to keep warm without doing much work. It is said that the snow there on the 1st inst. was from 6 to 15 feet deep, and the miners there were pulling up stakes in disgust.

ST. PATRICK MINE.—The various claims of this company yielded during the fiscal year 3,149 tons or ore and $64,484 gross in bullion. The improvements cost $23,955, and the total expenses were $82,809. The Crater claim is the only one supposed to be valuable, all the others having proved worthless as far as examined.

THE Marysville woolen mills are now running night and day, and afford a good local market for wool.

Sprague's Combined Sash Lock, Sash Holder and Weather Strip.

The storms of the past few weeks have no doubt forcibly reminded numbers of people that their doors and windows needed fixing. All the chinks and cracks have been discovered by this time and the invention which we illustrate in our engraving may, therefore, perhaps prove a welcome device to many, particularly as it is especially adapted to windows which are minus cords, pulleys, or proper locks, a state of affairs frequently the case in country houses.

The arrangement consists of a strip, *A*, resting alongside the sash, *B*, Fig. 2, on springs, *C*, placed to receive it, and secured by screws, *D*, with their heads against shouldered sockets, so that the movement of the piece, as regards sash and frame, may be regulated. The strip, *A*, is covered on its face with leather, so that it forms a tight weather strip, and by its elastic movement permits the sash to be held up at any desired point.

SPRAGUE'S COMBINATION SASH LOCK.

A section of this batten, *E*, forms the locking bolt, and is constantly pushed outward by a spiral spring, *F*. When opposite the recess in the window frame, as shown in Fig. 1, the action of the spring forces the pivoted section therein, thus firmly locking down the sash. When it is desired to raise the latter, it is only necessary to pull down the hook lever, *G*, which contracts the spring and withdraws the locking piece. The section, *E*, is faced and forms a continuation of the weather strip; and by jointing it to the lower end of the piece, A, the device is rendered suitable for the upper sash. This device is the invention of E. J. Sprague, of the firm of Sprague & Miller, Youngstown, Mahoning county, Ohio, who may be addressed for further information.

The Largest Gold Bar.

The *Scientific American*, of the 6th, has the following item: "The largest bar of gold ever produced, was lately made up for exhibition at Helena, Montana. The value was $50,000; weight, about 172 pounds; fineness, 900."

Our cotemporary is mistaken. The largest gold bar ever made was that produced by the Spring Valley Canal and Mining Company, of Cherokee Flat, Butte county, California, in October of this year. This bar was valued at $71,273.15 at the mint. It weighed, before melting, 3,580 ounces. The dimensions were as follows: 14 inches long on top, 13⅛ inches on bottom, 5 inches deep, 5¼ inches wide on top and 5¼ wide on bottom. One ounce and eleven-hundredths were lost in melting. This bar was the result of a partial clean-up, after thirty-five days' actual run with 1,000 inches of water. We say partial clean-up, as the gold in the bar was obtained from 800 feet of head flume and fourteen under-currents; while the company has *two and a-half* miles of flume and twenty-eight under-currents.

This same company sent down a bar of $60,000 last month, and, it is expected, will ship one worth over $70,000 this month. They are paying $40,000 a month dividends on a capital of $4,000,000. They have plenty of water, and can wash out of Sugar Loaf and Taule mountains from $75,000 to $100,000 per month.

The big bar referred to by the *Scientific American*, was made up by the agents of Seligman & Co., at Helena, Montana, for the special purpose of exhibition—it consisting of purchases of gold from various claims. Several $40,000-bars were received here before Seligman's $50,000-one was made up. The Spring Valley company washed their gold out of their own claim, and think it will not be long before they eclipse their former efforts in this line, as they have lately purchased additional water rights, which will add to their facilities for work.

VENEER KEY.—Geo. W. Swan, San Francisco Cal. This invention relates to a key made of thin shavings or veneers of wood, wrapped around a cylindrical form and provided with heads at each end. A strip of canvas is wrapped around the exterior of the key and secured by any suitable adhesive substance. It makes a cheap key, and when lined with a loricator, (which is also the invention of Mr. Swan), it can be used to hold liquids and other substances which are usually contained in keys.

The above item appeared in our issue of Nov. 29th, under the head of "Notices of Recent Patents," and sounds like a conundrum. As we fear some of our readers may lose their reason in endeavoring to unlock the mysterious meaning of the item, we rise to explain. By inserting the word *keg* in every instance where the word *key* occurs, the key to the puzzle is obtained. We are of the opinion that our patrons are all sober-minded men, not accustomed to stay out "late o' nights" at the club, otherwise Mr. Swan would be overwhelmed with orders for a "cheap key" which "can be used to hold liquids." Our proof reader must have been in a hurry to eat his Thanksgiving turkey the day he read that item; at least that is the explanation he makes to us. He is sure he had not been to dinner when he read it.

IT IS proposed to urge a bill in Congress for the establishment of some Government price per acre for both agricultural and mineral lands, in order to avoid unnecessary contests as to the mineral or non-mineral character of lands.

Grass Valley Mines.

In addition to the mining news in our "Mining Summary" we condenee the following from the Grass Valley *Union* of Dec. 3d, concerning the mines of that locelity:

The month of November wes a profiteble to the miners of Grass Velley district. The dry weather kept only a few mines idle while it wes just the thing for prospectors. Accordiugly there was much work, in a prospecting way, done during the month and in most instences the work proved profiteble. The prospecting husinese is retarded in this district by the fact thet a large number of the ledges here are loceted and are held hy owners who are weiting for something to turn up. No men wants to work and find gold on another man's ledge. After the firet of next June these locations will heve to be worked or they will be liable to a relocetion. There are meny claims in this dietrict which ought to he worked or jumped, and they must he after the date we heve nemed.

Eureka.

The Enreka kept 15 stamps running during the month, and with them in four weeks, or 24 days, took out about $25,000. There are no changes in the lower portione of the mine.

Empire Mill.

The rnn of the Empire for the month of Novemher gave about $14,000, which is not as large as the yield for the month previous. Still the $14,000 yield gave a good profit. The underground appearances have improved considerahly of late, and the current month will see an increase of gold over the last.

New York Hill.

Since onr last report work has gone on steadily. The main tunnel has heen run about 150 feet and there are indications of approaching the ledge. The ore taken from the old tunnel is being hauled to the mill for crushing, and will prohably be all in this week if the weather continuee favorahle. Work is being pushed in the upper tunnel and a large amount of first-clase ore ie being taken out. Free gold appears plenty in the rock which is also rich iu sulphurets. The proprietors are managing very carefully, heing determined to make the mine pay its way. The ore costs $2 per load to take it out and the hauling and crushing $4. Even low grade ore will yield a profit at that rate. The fact of no machinery being needed for working the mine leseens the expense of working very materially.

Harvey

Is the name of a newly discovered ledge, situated on Clark's ranch, near the North Star mine. It is reported that the croppings of the ledge exceed in richness anything yet discovered in thie dietrict. The ledge is also eaid to he a very large one. Specimens from the mine, some of which we have seen, are very rich.

Ben. Franklin

Is again being worked. Great profits were made years ago ont of this mine, and there is no reason to suppose that the pay ore ie exhaueted. A tunnel ie heing run in on the ledge, and ie now in a distance of 175 feet.

North Star.

This mine continues work in the new ehaft. It yielded about $14,000 last month, all from the new works. The old mine shows no improvement.

Slate Ledge

Is opening the 5th level. This mine is hetter known as Perrin's. The ledge on which the poete set, more than pay for the opening of the level. To ehow the quality of the rock we mention that a quantity of rock which cost $900 to mine and mill, paid about $5,000 in gold. Affairs at Perrin's are flonrishing.

Greenhorn.

The depth of the shaft ie 496 feet. On the 460 foot level drifte have been run north and south. The ledge in the drifts is 2½ or 3 feet thick. The rock is now being cruehed to test its value. The Greenhorn company is a plucky one and does not ohject to prosecuting work underground.

Pittsburg Mine

Is located near Deadman's Flat, some four or five milee eouthwest of Grass Valley. It is about a half mile north of the Seven Thirty mine. The shaft ie down 63 feet, and the last 25 or 30 feet of the shaft is through very fine ore. This mine has sent to the mill and crushed 49 tons of ore, and that yielded about $50 per ton or $2,450. The mine is owned by Robert McCook, David McCook and County Treasurer elect, E. P. Sanford. None of the owners have had to pay a cent for working the mine, and have divided hetween $200 to $300 of profits hetween them. The ledge ie between two and a half and three feet in thickness. The Pittsburg ought to he incorporated.

Kentucky.

The five-stamp mill started on Monday laet to crush the rich ore of the Kentucky mine. The lowest depth of the mine is 235 feet, and drifte have been run eaet and weet a dietance of shout 50 feet each. No stoping hae yet been done. About 300 tone of ore are on the dump pile waiting to he crushed. This wae taken out of the shafts and drifts. A large clean-up ie promised from the Kentucky, and aesessments are not likely to he heard of again in that mine.

Brown Brothers,

On Squirrel creek, have opened np their ditchee and have built a large, new reservoir. They have pipes all in place, and are waiting for water to come, when they will put their hydraulics to work. The Brown Brothers' claims have always paid well.

Idle.

Massachnsetts Hill, Rocky Bar, Scedden's Flat, Stockbridge end other mines in the Massechusette Hill neighborhood, which teken together are estimated to be one of the best mining propertiee on the coaet, are etill as "idle ee a painted ship npon a peinted ocean." In this category are aleo the Wieconsin, Harterey, Allieon Rench, Cambridge, Howard Hill, East Eureka and other mines.

Baltic Company,

On Randolph hill, heve lately acquired hy purchase, a large body of mining gronnd. The mine ie gravel and will have to be worked by drifting. Work will, we understend, soon be resumed on the Baltic's claims.

Independent.

Grevel mine will have its tnnnel completed by Christmas, when the gravel will be drifted out and put through the mill. The Independent has a large body of rich gravel.

Town Talk.

This little gravel mine continues to yield to its two owners ahout a thousand dollars a month in profits. It will soon start to work with water-power, and give its steam engine, which it runs in the dry season, a rest.

Dartmouth.

Capt. Miller, the energetic Superintendent of the Dartmouth, has everything at the mine in fine shape for working. He has an 8-inch cylinder steam engine in place for hoisting and pumping purposes. When water comes so that the gravel can be crnshed and washed, he will commence hoisting to the surface. The Dartmouth has on hand a splendid supply of wood for steam, and timhere for the underground work.

Nevada City

Ie doing some good work in the way of mining, thongh the minere there are not in the habit of going deep enough into the bowels of the earth. The *Transcript* gives following two items:

We understand that not long since G. W. Baldwin leased a quartz ledge of Hemilton McCormick. The ledge is eituated out on Gold Flat. Mr. Baldwin has heen at work on the ledge for some time, and has now a ledge ahout eighteeu inches in thickness, and running through for eome distance can be eeen a streak of gold, and the specimens we saw were magnificent. Mr. Baldwin hae got a large lot of quartz which he is now having crushed at Murchie's mill.

Mr. Berry, euperintendent of the Nevada quartz mine, informs ue that sufficient water had fallen to etart up his mill. On Saturday forenoon there was sufficient to run ten etamps, and late in the evening he was enahled to etart up twenty stampe. The mill will now be kept running constantly, and the old Nevada is bound to give a good account to ite owners. The new ten-etamp battery of the Gold Tunnel mine wae also started up yeeterday morning.

At Rough and Ready

There is soon to he active gravel mining. The Picayune is ahout to he started to work drifting into Randolph hill. The Eherlin Brothers are getting good prospecte from their mine on the lower part of Randolph hill. Most of the claims there are ready and waiting for water.

The Franklin Mill.—The Gold Hill *News* says: Thie ever active and well ordered ore-reducing institution on Carson river, a couple of miles above Dayton, under the superintendence of our worthy friend John W. L. Hunt, Esq., is keeping up to the mark in the way of doing good work, although only running to one-half its capacity at the preeent time, owing to the low stage of the water in the river. Tbe mill is very eligihly and pleasantly located, has twenty stamps, eight Wheeler pans, four eettlere and ie eesentially a water mill, all the machinery with a proper eupply of water heing propelled by a particularly effective Leffel turbine wheel. The mill is running on ore from the Belcher mine, reducing at the rate of thirty tons per day. Ite full capacity is sixty. A hig Archimedean screw elevator raisee the tailings to a proper hight, allowing them to he conducted by a flume to the capacious reservoirs on the flat hy the river side, half a mile or so ahove the mill, and the dam, and all other arrangemente pertaining to the coucern, are of the moet approved and snbstantial description. Mr. Hunt is one of the hest experienced mill euperintendents in this section; therefore, he never lacks for a good position in that line.

International Mill.—The White Pine *News* says: This new structure having heen fully completed and placed in perfect order, wae dedicated on Wednesday laet by starting the engine and machinery. Parties preeent were earnest in their praises of the working of every portion of the mill and accord great praiee to all concerned in its erection. We have been unable to visit Eherhardt in person the last week, and connot give as full a description of the starting ae we would wish. However, it is becoming to say that mainly through the great exertions of Manager Frank Drake and the competent ascietante are we indebted for another eource of revenue to our proeperity. It is a matter of congratulation that we have at least one mill to be run during the coming winter, and we are aesured that no stoppage will occur from want of energy on the part of the managers.

San Jose Mining Company.

Dnriug the week pest we had the pleasnre of meeting Judge Bartholomew O'Oonnor and O. G. Leach, from Egen Ceñon, who visited Hamilton on bnsiness. From them we learn that the affaire of the San Joee company are progreseing satisfectorily under the immediate eupervision of Gen. W. S. Rosencranz, the president, and that in a few days active mining operetions will he commenced. The property of the compeny consists of several mines and two mille—one of twenty stempe and another of five. The main shaft on the minee hae heen sunk on an incline to the depth of 640 feet, but hes heen lying idle and unworked for eome time on account of the large amonnt of weter flowing. Mr. Leech, who is the superintendent, informs us that with the new Knowles' steam-pump now in poeition, the water, which hee eccumulated to the depth of 65 feet, cen he thrown out in a few days and operations commenced on the ore.

At the extreme depth atteined, levels heve heen run end the vein cut, showing itself of good eize and of exceeding richness. It is proposed to run the 5-stamp mill on the oree raised, and good reeults may he anticipated from the same. The 20-stamp mill belouging to the company has heen leased for a term of months to John R. Murphy and George W. Bibbins, and will at once commence running on ores from the Tea-cnp and Geneva mines, at Cherry Creek, four miles distant. The latter gentlemen, we are informed, have honded the mines mentioned for $65,000, from the locators, and, it is aeserted, have an excellent prospect of working snfficient ore from them during the comtinuance of the hond to pay the purchase money and have the mines left. In conjunction with the bonded property it ie proposed to work euch custom rock as they can, for the benefit of miners in the district. All parties who have visited the new camp coincide in the opinion that the snrface croppings for a number of miles exceed anything ever hefore discovered, and work, thue far, has demonetrated the important fact that as depth is attained the reeulte are flettering in the extreme. When the mills are once fairly etarted, Egan Cañon will ehow a degree of life and activity unequaled during the last four or five yeare. We congratulate the San Jose company on their pereistent efforte, aud sincerely truet the new impetus given their property by the adjacent intereete at Cherry Creek, may accrue to their financial advantage, hoth now and hereafter.—*White Pine News.*

The *Record* in its weekly review speaks of the Raymond & Ely mine as follows: Now working about 200 men on top and below grouud, and extracting the usual amount of ore, abont 65 tons daily. Seventy-five men are doing dead work. The main ehaft is now down 1,004 feet, and the 1,000-foot level is now being put in. The ore in the ninth level ie ahout two feet wide and of good quality. In the eighth level notbing is beiug done except dead work. In the eeventh level a great deal of ore is heing extracted, and the ledge is 20 feet wide in eome placee. Winzee are being sunk on the seventh level, aud a drift ie heing run towards the Pioche-Phenix line. The office and residence of the Superintendeut are undergcing many improvements which we will take occeson to notice more fnlly at no distant day. Yesterday the workmen in the main drift of the seventh level, while putting in a sill in the drift, struck a hard substance, and put in a blast. To their surprise they hroke off a very fine epecimen about two feet long, ten inches wide and four inches deep, which will assay not lees than $300 per ton. There is in that part of the mine an immense body of the same kind of ore. Two new boilere, 52 inchee in diameter and 16 feet long, will soon be in place—most likely during this week. The fire front as well as the boilers, was mannfactured at Marysville, Cal. There are also two reele, gotten up by George Ames, whioh are very useful in caee it should become necessary to remove the cahle from the hoisting works. Each reel is capable of receiving 2,000 feet of cahle. Everything about this mine is of tbe hest quality, and no neceseary expense has heen spared in the procurement of the hest machinery and in the employment of the hest talent in the development of its vast proportions.

Find Claims.—Now that there is a certainty of an abundance of water from the Amador canal for all purposes, we would direct attention to the numerous gravel hills along the line of the canal, extending from Slahtown on the eaet, to Ione valley on the west. But very little proepecting has been done along this range of hills, but wherever tunnels have heen run into them, good pay hae been the result. Properly worked by hydraulic process, these hills will be found to yield well, and now is the time for our miners to prospect and make locations along thie line of hills, as, by the time work necessary to the erection of hydraulics shall be done, the water from the canal will he ready for use. Extensive claims can be had, and by the improved procees of gravel mining apparently poor ground will yield rich returns. South of town, lies a large area of valuahle placer ground, unworked for want of water, but to which water can be conveyed. Thie section should he prospected, and if found valuable, water from the canal will be conveyed to it. There are many rich localities in the vicinity of Jackson, that ought to be profitably worked as soon ae water can be had. Therefore, secure claime, and have them fully prepared by the time the canal ie completed.—*Amador Ledger.*

Mineral Lands in California.

The message of Governor Booth contains the following in reference to mineral and non-mineral lands: The Surveyor-General, in his report, reiterates the suggestion mede by his predecessors in office, that a finel adjudication hy the Court wonld determine that the United States made no reservation of mineral lands in granting to the State every sixteenth and thirty-sixth sections within her horders.

The question is an interesting one, and it is important that it ehould he decided.

Thet the General Government should make snch a marked departure from its recognized policy of reserving mineral lands, and ehonld concede eomething more than two million acres to California, in the richest minerel belt yet developed in the world, is not to he assumed too readily; hut if a thorough examination estahlishee the fact, the eooner a clear nnderstanding upon the subject hetween the Generel Land Office at Washington and our State authorities ie arrived at, the hetter it will be for the security of mining and land titles. Under onr statnte, many locatione of sixteenth and thirty-sixth eections have already heen made in mineral dietricts, which may in the end prove valid; and it will eerve to illustrate the importance of the queetion to mention the fact that in some instances locators have thns attempted to acquire complete title to valuahle mining claims held in adverse possession under general laws.

Legielation looking eepecially to the sale hy the State of the sectione in question, would, in my opinion, be premature and likely to canee mnch confusion and insecurity, and wonld meet at the outset the opposition of the Department of the Interior, which now assumee to have the final control of this claes of lands. The act of Congrese of July 9, 1870, providing for the sale and patenting of placer mining lands makee no reference in terms to school sections; and the Act of Congress, approved July 23, 1866, "to quiet land titles in California," the theory of which was to define the rights and properties of the State and the General Government respectively nnder the various grants, expressly reserves the mineral land to the United States and refuses to confirm snch sales thereof ae the State had made during the preceding 16 yeare. It is probable, therefore, that Registers of the United States Land Offices would he slow to recognize any title that may possihly vest in the State. Tbe question, too, of how to hest secure in the event of a deciaion in favor of the State, is a grave and complicated one, and ie one that naturally requires the assietance of the authoritiee at Washington in its determination.

But, whether or not the law is positive in its terms, and whether the grant was made with or without reservations twenty years ago, further unneceeeary delay cannot he of service to either the General Government, the State, or citizens interested in knowing the truth; and the subject is commended to your careful conaideration.

Caribou Mines.

A correspondent of the Colorado *Register* writes as follows from Carihou: The finest weather prevaile up here among the monntain tops. Contractors are buey completing their contracte, and miners in making preparatione for the winter. The Mining Company Niederland are pntting up machinery for hoisting ore, which for perfection of detail, strength and durability is equal to the hest in the country. They employ oue hundred and twenty-five men, and are raising twenty tone of mineral per day. The greateet depth attained ie 330 feet, and tbis on the discovery shaft.

Mr. James Dawley, contractor for driving the Caribou tunnel, is pnshing the work as rapidly as possible. The tunnel is now 500 feet long, and it ie expected to etrike the Caribon lode early next epring. The Sherman mine is being worked hy a party of eight men, who are about to erect a large huilding over the main shaft, and will prosecute the opening of the vein with great vigor thie winter. The ehaft ie 85 feet down. They are now running drifte eaet and west from the hottom. In the former a etreak of mineral about two feet thick is exposed for the distance of 25 feet, estimated to he worth from $300 to $600 per ton in silver. This mine ie always quoted among the most valuable in the district.

The No Name ie worked hy Donald, Leeher & Co. with excellent results, and with a emall number of men they are taking out a large quantity of valuable ore.

The vein of the Columhia is heing stripped about 400 feet in length, and a strong trne fissure vein, carrying a body of rich ore, has heen nncovered at the depth of ten feet. Eight or ten other minee are under development, among which are the Ten-Forty, I X L, Poor Woman, etc., etc. A number of huildings are also going np in this locality.

Mint Coinage.—The coinage of the Mint for the month of November amounte to $251,500—all in silver, apportioned thue: $31,000 in quarter dollars; $29,500 in dimes; $79,000 in half dollars; and $112,000 in Trade Dollers. No gold hae been coined during the month. The orders are to coin $100,000 in silver every month, for ehipment to the East, and all the Minte in the country will he kept running on silver to provide for the resumption of epecie payments.

MECHANICAL PROGRESS.

Gas-Burning Locomotive.

The greatly increased cost of coal in England has called scientific attention to the economizing of fuel, and as an outcome of all the discussion and agitation, we have the numerous inventions for making and using gas that we have already noticed in this column. The latest invention brought out is designed to combine both gas making and using in one engine and at the same time. The locomotive is of the ordinary clumsy and awkward type used in England, except that there is no fire-box and that the tubes are quite large. Inside each tube is a gas pipe, with numerous jets on its upper side, and from these the gas escapes and burns in the tubes. Air is supplied at the rear end, and the product of combustion escapes into the stack in front. The gas is made by forcing atmospheric air into naphtha, petroleum, or any other hydrocarbon, and collecting it in a reservoir or tank from which it may be pressed into the pipes precisely as pressure is given to ordinary street gas. The gas-machine, oil tanks, reservoir, etc., are placed on the tender, and the air pump that supplies the air is connected with the cylinder at the front of the engine. The engine thus makes its own gas while running, and supplies its own fuel till the hydrocarbons are exhausted in the tanks. To get up steam and start the engine, manual power must be given to the air pumps till enough gas has been made to fill the reservoir. Another way, would be to supply the reservoir with gas from a stationary reservoir beside the track till steam was up. We have no data concerning the speed or hauling power of Mr. Walker's engine. We doubt if the experiment has gone beyond the woodcut stage, but it is highly spoken of by the best English authorities, and very great things are expected of the invention. It can be also supplied to all other kinds of engines both marine and stationary, at a very great saving of expense and a great gain in storage capacity. Whatever the final results of this gas problem, Mr. Walker's patents will give the matter a great impetus in a new and unexpected direction.—*Boston Journal.*

Liquid Slate for Roofs.

Some years ago our attention was called to the enormous amount of slate-dust which accumulated at the slate quarries, and the desirability of inventing something to be mixed with the same so as to form a paste or paint which, after hardening or drying, would form an artificial stone. This desideratum has been accomplished. By its cheapness (only 80 cents per gallon) it is accessible to all, and is found the best possible covering for roofs, being a cheap substitute for the soldering and painting of old leaky tin roofs; and it will even transform a worn-out shingle roof, when put on thick, into a new fire-proof slate roof, as a coat of it is better than a new layer of shingles. Such roofs will not then take fire from falling sparks, which old dry shingle roofs are very apt to do. No wonder therefore that insurance companies regard this invention with much favor, and reckon on it when making up their insurance rates, and that the trade in this article is so enormously increasing. It has been applied to more than half a million houses, of which 65,000 are in New York, 18,000 in Buffalo, 12,000 in Rochester, 10,000 in Albany, etc.

It is estimated that in New York State alone half a million dwellings are covered with shingle roofs, and in the whole of the United States 14,000,000 roofs needing protection from fire. In using this compound a considerable deduction in the total insurance rates yearly paid would be the result, so that it would be doubly advantageous to all who own or use buildings. We take pleasure in recommending this preparation to our readers, and feel confident that it is worthy of trial.—*Manufacturer and Builder.*

POWER FOR SAWS.—In regard to the power required for different sized circular saws, one correspondent of the *Scientific American* expresses the opinion that "a saw just large enough to cut through a board will require less power than a larger saw, the number of teeth, speed and thickness being equal in each." This theory is opposed by another correspondent who says: "I am running three saws, one 48 inches with 48 teeth, one 52 inches with 42 teeth, and one 64 inches with 56 teeth, all 8 gauge in thickness; and I find the 64 inch saw will cut through a 12 or 14 inches cut with less power than either of the others. I differ with him concerning the saw with few teeth cutting the easiest, as my 52-inch saw with 42 teeth takes more power than either of the others; and I run the same hook in the teeth, and file them all exactly alike. My engine is small and timber large, so that I have every facility for finding out which cuts with least power."

A MAMMOTH BOILER.—The *Lumberman's Gazette*, of Bay City, Michigan, says: One of the largest boilers in the country has been recently put into Sage and Co.'s mill. Its dimensions are as follows: Length of outer shell, 20 feet; breadth, 11 feet; depth from top to bottom, 15 feet; inner shell, 18 feet in length, 9 feet in width, 11 feet in depth; the inner shell forming the fire box, which is supplied with heavy grates.

Glass Cloth.

In a late issue we gave some interesting details on the process of glass-spinning, as exhibited at Vienna. In continuation of this topic, the following notes on this industry, from *To-Day*, are timely:

The latest improvement in spinning glass are due to the Vienna manufacturer, Brunfaut, who exhibited his talent in this speciality in 1850, at Pesth. After manifold trials, he discovered a composition which may be made at any time into curled or frizzled yarn. The frizzled threads surpass in fineness not only the finest cotton, but even a single cocoon thread, and they appear at the same time almost as soft and elastic as silk lint. The woven glass flock wool has quite recently been used as a substitute for ordinary wool wrapping for patients suffering from gout, and its use for this purpose has been, it is stated, successful. Chemists and apothecaries have found it useful for filtering. The smooth threads are now woven in textile fabrics, which are made into cushions, carpets, table-cloths, shawls, neckties, cuffs, collars and other garments, etc. They may be used for weaving the figures in brocaded silk or velvet. As a material for fancy dresses, tapestry, for covering furniture, for laces, embroidery, hosiery, etc., the glass tissue will probably at some future time occupy a prominent place. Owing to its brilliancy and the splendor of its colors, it is the most beautiful material for dressing the hair, neck and head. In softness the glass yarn almost approaches silk, and to the touch it is like the finest wool or cotton. It possesses remarkable strength, and it remains unchanged in light and warmth, and is not altered by moisture or acids. Spots may readily be removed by washing. Being non-inflammable and incombustible, it is especially valuable for making dress materials for ladies. Clothes of glass fabrics are much warmer than those of cotton or wool; at the same time, they are of a low specific gravity.

WRITING MACHINES.—After all, we are inclined to think that the real solution of this problem of rapid and easy writing will be mechanical rather than alphabetic. It is the pen that is inadequate to the work that needs to be done. As an instrument the pen may be perfect of its kind, as the common sewing-needle is perfect. Neither pen nor needle is likely to be ever done away with; wholly; yet both fail alone to meet the increasing demands of our quick-moving civilization. The sewing-machine has come in to do the great bulk of our stitching. We must have a machine to do the same for our writing. The letters must be struck with a metal type instead of being traced by hand; and the writer's part must be confined wholly, or chiefly, to the touching of appropriate keys. With such a machine the distinctness of the writing will no longer be at the mercy of unsteady or undisciplined nerves and muscles; the characters may be as complex and significant as those of Bell's *Visible Speech*, or even the Chinese, without increasing in the least the labor of writing, and the "copy" will correspond exactly with print. The degree of success already attained by several inventors of writing-machines gives every assurance that the manual labor of literary workmen is certain to be greatly diminished. May we hope that the quality of their work will be correspondingly improved.—*Ex.*

DIAMOND SAW.—At the American Institute Fair a diamond saw is at work in the machinery department, in the form of a neatly built iron model, one-fifth the size of the more cumbrous wooden apparatus. The blade, it will be remembered, cuts through the stone by means of carbons or black diamonds which are securely set along its edge. There is an ingenious feed motion for moving the saw, and another device to lift the latter, consisting of an excentric on the crank pin communicating with a knuckle joint and levers, so that it is allowed to cut only in drawing. The small machine exhibited, we are told, penetrated brown stone at the rate of fourteen inches and marble at seven inches per hour. A novelty about this invention is its application to the cutting of window moldings. Bevels are made by suitably turning the stone, and rounded edges by gradually moving the latter under the saw. The work exhibited to us was very smoothly cut, and especially noticeable for its clean and sharp angles. The apparatus, the inventor thinks, does the labor, in moulding, of from twelve to fourteen stone-cutters.—*Scientific American.*

FIRE-PROOF JOISTS.—An efficient joist has been invented by Mr. J. Walker, London, for which are claimed many advantages. It is as strong as the ordinary joist, if not stronger, consisting of a slip of wood five inches wide by five-eighths of an inch thick, bolted between two flanged stripe of quarter-inch iron. An ordinary joist of eleven inches by three can be cut up into eight of Mr. Walker's pattern. The iron sides, besides affording strength, are claimed to render the joist practically fire-proof, while the center of wood affords the means of putting down floors in the accustomed manner, and gives the usual facilities for lathing, so that the architect has at his disposal precisely the same basis for ornamentation as if ordinary joists were used. The obstacle to the manufacture of these joists has hitherto been the difficulty of rolling the flanged iron sides, but this has been successfully overcome by Messrs. Thorneycroft, and thus an opportunity is afforded of testing the merits of Mr. Walker's invention by employing it in some structure.—*Iron.*

SCIENTIFIC PROGRESS.

Revolution in the Alkali Manufacture.

The present method of manufacturing alkali—known as Leblanc's process—consists in decomposing common salt with sulphuric acid, roasting the resulting sulphate of soda, technically known as salt-cake, with an admixture of ground coke and limestone, and subjecting the crude mass thus obtained to certain refining operations. It is now stated, on the authority of Rudolph Wagner, that an entirely new method has been elaborated, verified, and is about to be introduced on the large scale at once in England, Austria, and Germany. Common salt in solution is mixed with the bicarbonate of ammonia; the result is bicarbonate of soda—which crystallises out—and chloride of ammonium (sal-ammoniac), which remains in solution. The latter liquid is distilled along with limestone, the result being carbonate of ammonia, which is collected, and chloride of calcium, which remains in solution. Meantime the bicarbonate of soda, or such part of it as is not required to be sold as such, is furnaced and thus converted into dry carbonate of soda or soda-ash. In this operation it loses half its carbonic acid, which, being led into the bicarbonate of ammonia, is ready to use along with a fresh lot of salt. The only materials thus consumed will be common salt and chalk, or limestone, and the only refuse yielded will be chloride of calcium, which is not incapable of being utilized. The stock of bicarbonate of ammonia will circulate with a waste, which, in case of careful working, will be inconsiderable.

The soda-ash produced will be very strong and pure, free from alkaline sulphates, sulphites, sulphides, and hyposulphites, as well as from a variety of other foreign matters now rarely absent. Soda-crystals will be made, as at present, by dissolving soda-ash in water and allowing to crystalise at the proper degree of concentration and of temperature. Caustic soda, now prepared from certain residual liquors technically known as "red liquor," will have again to be made on the primitive method of treating solutions of carbonate of soda with slaked lime. The nuisance of hydrochloric, sulphuric, and arsenical fumes will cease. "Vat-waste" will no longer be formed and the ingenious processes for obtaining from it hyposulphite of soda and for recovering the sulphur it contains will come to an end.

There will be a heavy fall in the price of sulphur and sulphur-ores, such as iron-pyrites, some of the inferior varieties of which, poor in sulphur or rich in arsenic, may possibly become unsaleable. As to sulphuric acid, the supply will fall off perhaps more rapidly than the demand, and a rise in price is not unlikely. Hydrochloric or muriatic acid, now a waste product which the alkali-makers are bound by law to condense, and are glad to sell at a very low figure, will require to be made expressly when wanted, and will consequently rise in cost. With it must rise bleaching-lime and all substances whose manufacture requires the use or hydrochloric acid. In short, if the project proves a commercial success, chemical manufactures will undergo a change such as has never before been witnessed.—*Iron.*

Fusion of Platinum.

In a note on the fusion of platinum, a foreign journal of recent date says: The following arrangement of a furnace enables us to effect this fusion easily, and to produce a temperature which may be useful both in research and in practice. In a saltpeter refinery at Lille, there is a large chimney, 30 meters high and 1 1-5 meter in diameter. It serves for a vent to eight large steam boiler furnaces, fed with coal, and which maintain a constant and energetic draught. A small door, opening into the base of the chimney, and generally closed by a small brick wall, communicates with the interior. Before this door, at the foot of the chimney, a small wind furnace is constructed, of which the outside bulk does not exceed a cubic meter. The grate of movable iron bars, is a square of 0·30 meter. The capacity of the fire box is 45 liters, and the flue communicating with the interior of the chimney is one-fifth of a meter in width. The first experiments were made with coke as fuel. Parisian and Hessian crucibles were tried, as well as those of black lead and lime, and in each were placed, to try the heat, about 50 grammes of iron nails. The operation lasted scarcely an hour; the combustion was very active, the draught roared loudly, and the light of the fire was dazzling. In every case, crucible and metal were fused together, leaving on the bars a vitreous slag. Coke was replaced with gas coke, in the hope of obtaining a more moderate action. The phenomena were the same, but even more intense. The best result was obtained by cutting a piece of gas coke into the shape of a crucible, and placing it within a Hessian crucible. In this 50 grammes of platinum were placed, partly in the spongy state and partly in clippings. After the fire had been maintained for an hour, a button of platinum was obtained, perfectly fused, and weighing 50 grammes. The experiment of Ebelmen was repeated, who obtained crystalline alumina, by heating in a porcelain furnace a mixture of alumina and borax. After the borax was volatilized the interior of the crucible was covered with a layer of small hard crystals of alumina, translucent and very brilliant.

Purifying Iron.

M. Tessie du Mothay, the well-known French chemist, has invented an improved system of purifying iron, which he thus describes: I proposed to myself the application in the manufacture of pure iron and steel pig iron of all qualities, whether containing separately or in combination, sulphur, phosphorus, arsenic, or silicium. It is known that such pig iron cannot be converted into malleable steel fit for rolling into rails, sheet, tires, etc., either in the Bessemer or other similar apparatus, or in the gas reverberatory furnace. With the object in view I have created the method which forms my present invention, and of which the following are the distinctive characteristics: 1. An apparatus which I call an aerodynamic purifier, which allows to pass through the molten metal, by reason of difference of density, certain fusible chemical compounds which possess the property of taking up the metalloids, which render it impure so long as the action of the air or of oxygen continues in the decarburation of the cast iron, either completely so when it is being transformed with iron or steel, or partially so when the production of fine cast iron is the result. 2. A mode of preparation of cast iron to be treated in my apparatus, or any other of like kind, to ensure the refining shall be carried on without the metal ceasing to be liquid, until the whole of the carbon is completely eliminated. 3. The construction of a special base or scoria containing chemical agents, purifiers whose point of fusion is below that of the temperature of fusion of cast iron, and of less density, and having for its essential object the fusion of the lime contained in the fluoride of calcium, and in the oxides of iron and manganese, this base possessing the quality more than other of fixing, in presence of fluoride of calcium, sulphur, phosphorus and arseniates, so long as the action of the air or of oxygen continues. 4. The employment of spiegeleisen and ferro-manganese in successive additions to complete the action of the above base or scoria during the passage of the air through the iron which is being decarbureted. 5. The novel employment of the peculiar property of ferro-manganese allied with tungsten and titanium, to render soluble and malleable steel which still contains a definite amount of sulphur, phosphorus, or arsenic, when the metal iron from which they are made shall have been previously completed or almost completely decarbureted, either in the purifying apparatus or in a gas reverberatory furnace. 6. In fine, a process of producing steel indirectly from cast iron containing phosphorus, sulphur, arsenic or silicium, by converting it into fine metal in any suitable apparatus by aid of chemical purifying agents.

DEFECATION OF DRINKING WATER.—WORTH TESTING.—Professor Gustav Bischof, of Glasgow, has improved on his invention, and filters water through spongy iron and pounded limestone. The iron is placed in the upper movable chamber of an earthenware filter, and pounded limestone is arranged in a separate layer below. The iron is procured in a powdery, spongy state, by the reduction of an ore without fusion, after the extraction of sulphur and copper by heat. It removes all albuminoid and nitrogenised compounds, and also lead contaminations, from the water; and a trace of iron taken up by the water is separated by its subsequent passage through the limestone. One charge of the material, costing one shilling, secures efficient filtering for ten gallons of water per day during 200 days.

AN examination of the amount of gaseous constituents in samples of deep sea water obtained during the *Porcupine* expedition of 1869-70, showed that both surface and bottom water contain more carbonic acid and less oxygen in the more southern than in the more northern latitudes, the examinations thus made embracing samples taken from localities extending from the Faroe Islands to Lisbon. Contrary to the general supposition, however, there is found to be no greater quantity of dissolved gaseous constituents in the bottom than in the surface of the water, although it is admitted that the power exists of pressure at great depths to retain gases in solution if once evolved there.

BY the use of thin leaves of the steel in the construction of artificial magnets, a French scientist has so increased their power as to construct one weighing about four and a half pounds, which could carry a weight of ninety-nine pounds. The great advantage to be expected from this discovery is the reduction in the weight of the magneto-electric machines of all kinds, and especially those employed in the production of light.

ANILINE is one of the products of coal tar. This is the great source of the new colors of every shade, surpassing in number and beauty the hues of the rain-bow. Lately a blue color superior to the aniline has been obtained from anthracene, another of the coal tar products. It withstands the action of the light better than aniline blue, and the strongest acid only lightens its tone. Unfortunately, however, it is very expensive.

MR. JOHN AITKEN has observed, that after the same water has been melted and frozen a number of times, it generally burst the tube in which it was frozen. This he explains on the hypothesis that ice containing air is viscous and adapts itself to the form of the vessel; by repeated freezings the air is removed, and the pure ice, being less or but little viscous, will not so easily adapt itself to the enclosing walls.

Weekly Variations in Stocks.

Based on Regular Sales of all Stocks in the San Francisco Stock and Exchange Board.]

Our Weekly Stock Review.

THURSDAY EVE., Dec. 11, 1873,

The Stock Markst has shown an improvement this week; hut during the coming holidays probably is ss hnsiness will be dons. The late storm insurss a plentiful supply of water for our gravel mines and rensvsd activity in all classss of mining in the spring. The dividends from mining companies this month amount to considerable, however. Belmont pays 50 cents per shars, aggregating $25,000; this is the third dividsnd of the company, ths other two having hsen paid in Febrnary and March. The Consolidatsd Amador mins pays 60 cents per shars. The Eureka, Grass Valley, dishurses $1 00 per shsrs, or $20,000. Belchsr pays $5 00 per share, or $520,000, and Crown Point $3 00 per share, or $300,000. The last named mines have been paying very large dividends for some time, larger than any other mines ever worked on this coast. The *Alta* calculates the dividends as follows:

	Old Div. Shares.	last Div. 10 months.	Previously.	Total.	Per Share
Belcher	10,800	$6,136,000	$3,215,120	$9,361,120	$900
Crown Pt...	12,000	4,800,000	3,498,000	8,498,000	708
Total....	22,400	$10,900,000	$6,713,120	$17,849,120	$800

This amount of $10,900,000 has heen paid to the stockholders in ten months, and is not the whole prodnction, which has been $30,422,000, and the production is still in its greatest vigor and most brilliant prospects. We review these figures at this moment in order to recall the jeers with which an estimate, of a leading owner, of $20,000,000 was received by hears and wisoacres when we announced it two years since. The mines have given $30,422,000 of metal to the world, and are apparently good for as much more. While this development has been going on scores of speculative brokers have been ruined selling the stock short on "sure information" that they were played out. Another great fact is now established. It is that the Virginia mines present a rival ore body, the announcement of which has been received by the public, taught by the example of Gold Hill, with far greatsr respect than was the ore body in that locality. Ths ore in ths Consolidatsd Virginia is now well developed, and about $80,000 per week is received hsrs. Tbs progress of development shows that ths highest expectations may hs entertained. The sinking of the north winzs has now reached a depth of 113 feet, and carries richer ors; at the sams time ths banging wall carries its sastern dip in a manner to prove ths continuance and increasing breadth of the vein. The south winzs is down 57 feet on Best & Belcher line, in rich ore. The connection of the sevsral lsvels will soon he made and the hullion production assume large proportions.

The Raymond and Ely mine has passed its dividend for this month.

The dividend of tbe Eureka mine is its 76th.

The Chollar-Potosi mine turned out last week 738 tons of ore and sent 554 tons to the mills; on hand at mills 9,453 tons; average assay value of ore $32 per ton.

The Buckeye sent 87 tons to mill and worked 160 tons; gross returns in hnllion, $1,614.

The Arizona mine shipped on the 6th, $1,145 snd the Justice shipped at same date $2,623.

The Belcher letter of the 6th says: "All the stopes throughout the different levels are looking remarkahl y well, and give good promise of a long continuance of fine ore. The winze from the 1,200-foot level is down 121 feet, and still continues to show fine ore. The south drift in the 1,300-foot level is in 503 feet, and continues in quartz with some good ore mixed. The incline is now down 196 ft. below the 1,300-foot level, and still in hard-blasting ground. The drift from the incline in the 1,300-foot level is now in 210 feet, and heing pushed rapidly forward to connect with the drift which is being run south from ths stopes in the same level. The general appearance of ths mine is at present very flattering. All our machinsry is in perfect running ordsr, and now that there is plenty of water in the river to run the mills up to their full capacity, we sxpect to give good returns for some months."

The Mahogany sent down $4,600 on ths 1st inst., and ths Raymond & Ely sent down $23,000 on ths 6th.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office, San Francisco:

SOUTH SAN FRANCISCO ARTESIAN WATER CO.—Dec. 6. Object: To furnish fresh water to customers. Trustees—David Hudson, J. W. Hodgkin, C. D. Wheat, B. F. Ellis and H. F. Williams. Capital stock $60,000, in shares of $20 each.

THE CALIFORNIA BUTTER CO.—Dec. 6. Object: To manufacturs bnter, fine oil for perfumery, and other useful products, from animal fat, and sell the same. Trustees—West Evans, President; John G. Baker, Secretary; F. A. Davis, Treasurer; Henry Phillips and George B. Van Brunt. Capital stock $300,000, in sbares of $100.

THE AMERICAN ICE CO.—Dec. 8. Object: To manufacture and sell ice at ths city of Lima, Peru, South America, and at other points in South and Central America. Trustees—Chauncy Bham, Robert N. Graves, Charles Land, S. B. Boswell, of San Francisc., and Georgs E. Sherman, of Oakland. Capital stock $500,000, in shares of $100 each.

THE QUINTERA MINING CO.—Dec. 10. Location: Philadolphia Mining District, in Nys county, Nevada. Trustees—J. D. Fry, A. K. P. Harmon, Robert Sherwood, David D. Colton and Oliver Eldrigs. Capital stock, $5,000,000, in shares of $100 each.

ARTICLES of incorporation of the H. A. Coal Mining Company, organized to conduct the business of mining for coal at Sulphur Spring Creek, Alamsda county, were filed on Saturday, in the Secretary of State's office, at Sacramento. Capital, $3,000,000; in shares of $100 sach. Directors—Wm. Meek, Wm. Hayward, Charles T. Ward, Jr., Charles R. Worland and Erasmus D. Brown. The principal plsce of business will be in the town of Haywards.

Meetings and Elections.

CONDOR S. M. CO.—Ths shareholders of the Condor Silver Mining Company held a mseting, called by ths County Judge, on Saturday the 6th instant, for the purpose of removing ths Trustees, Wm. Cline, Henry P. Wood, and H. C. Kibbs. The meeting was organized by the appointment of Dr. Washington Ayer as Chairman, and H. C. Kibbs as Secretary. The roll was called, and 19,319 shares were represented; the capital stock consisting of 25,000 shares. The Trustees were then removed by a vote of 18,935 shares to 384. The shareholders then proceded to elect Dr. Washington Ayer, S. H. Sheplar, Ira G. Hoit, D. S. Thomss, and H. C. Kibbs, as Trustees of the Company.

INDEPENDENCE CONA. M. CO.—December 8:—Trustees: B. A. Becker (Presidsnt) E. F. Chm, George Lawlor, Charles Staempfli and Joseph Assion.

GOLDEN SUN GOLD M. CO.—Dec. 8:—Trustees: L. J. Henry, A. E. Ball, Joseph Pentecost, Dorvills Libby and S. H. Sheplar. At a subsequsnt meeting of the Trustees, Samuel H. Sheplar was elected President, L. J. Henry, Vice-President, Dorville Libby, Treasurer, and O. A. Thompson, Secretary.

HEAVY BLAST.—On the 9th instant a blast of 450 kege of Santa Cruz powder, weighing 11,000 pounds, wae exploded in the Blue Point mine, Sucker Flat. It is estimated hy competent judgee that 40,000 cubic yards of gravel were prepared for washing hy this hlow-out.

MINING SUMMARY.

THE following is mostly condenced from jonrnals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

EXCHEQUER.—*Chronicle*, Nov. 29: Sinking will commence again in a few days on this mine, and the present drift continued.

ACACIA.—Work upon thie tunnel will he resumed in a few days, Dore & Jones having contracted to run 100 ft., or to the striking of the ledge.

CALAVERAS COUNTY.

TECUMSEH MINE.—*Chronicle*, Dec. 6: Work is going on without interruption in the celebrated Tecumseh mine, and they are making good progreee in sinking. The ore is constantly improving and hecoming freer from the base metals. The hottom of the shaft ie in good milling ore, carrying free gold, galena and iron sulphurets.

MILL STARTED. — Garland's new eighteen stamp mill, at Mosquito gulch, was started last Sunday. Everything worke to a charm. The mill is engaged crushing rock from the Good Hope mine. The mill will he a great benefit to that portion of the county, and will stimulate prospecting to an unwonted degree.

SAN BRUNO.—We are informed hy Mr. Edward McDade, who has taken a contract to get out rock in thie mine, that work is heing pushed forward vigorously, and that there is every prospect of the mine proving to he fully as rich in the future as it hae heen in the past. Mr. McDade is at preeent engaged in running a "raiee" in the mine, to enable him to take out the rock with greater ease.

MOSQUITO DISTRICT.—Work is progreseing favorably on all the quartz mines in the Moequito District. Prospecting is hrisk, and we expect to hear of eeveral "rich strikee" before Spring.

RAILROAD FLAT DISTRICT.—Petticoat stock ie in demand, although the mine is idle. It is rumored that competent parties will re-open the mine and extend the north levels. South level of Sauderson in 60 feet with 3 feet of ore in face, and substantial indicatione that the heart of this huge hody of rich ore has not heen reached ae yet. The ore in the raise, now up 20 feet, is estimated to mill over $600 per ton. The mine employs over 30 hande and the

Superintendent intends to double the force as soon as practicable. Sinking will be resumed and continued at an early day. Second-class ore—supposed to yield less than $200 per ton—is now being crushed in Clark's custom mill.

West Point District.—The last run of the Carlton mill, on ore from Stevenson & Co.'s mine, yielded at the rate of $30 per ton. A small engine has been moved to the mine since, and a portion of the property has changed hands....Main shaft of the Good Faith is over 80 feet in depth....Yellow Jacket erecting hoisting works....The main shaft of the Ohio Consolidated has attained the depth of 140 feet ....Fifteen tons of ore, taken from the middle tonnel of the Lone Star, yielded over $3,000 ....The Harris mill is being rebuilt in a very substantial manner, adding five stamps.

EL DORADO COUNTY.

Agua District.—Mountain *Democrat*, Dec. 6: A new company composed of Frenchmen, commenced operations recently near Frenchtown, in the lower end of this county, in what is known as the Agra Mining District, and they have already made a fine opening, with gratifying results and brilliant prospects, on a large vein of conglomerated porphyry, quartz and ocher, the vein being of great width and prospecting well throughout. The character of the vein and of the gold obtained from it is said to be a novelty and we are promised further and interesting particulars when it shall have been more fully developed. Great confidence in a prosperous future is entertained throughout the mining districts surrounding Clarkaville.

The Day and Hunter Mine.—We are in receipt of encouraging reports from the Day and Hunter mine, near Clarksville. After tunneling about eighty feet the ledge has been struck and fine prospects obtained. There are well defined hanging and foot walls, with from two to three feet of intervening ledge and vein matter.

Gold Mountain Mining Company. — The above is the name with which Messrs. Murray, Maffey & Co. have christened their valuable mine near Clarkeville. The mill is completed, and ready to commence crushing ore.

MONTEREY COUNTY.

Coal.—*Democrat*, Dec. 6: We are credibly informed that a fine vein of coal has been recently laid open on the Aromas rancho, the property of Dr. McDongall. It is located close to the railroad bridge across the Pajaro, and its position, as well as the quality of the mineral, must give it great value.

NEVADA COUNTY.

Idaho Mine.—Grass Valley *Union*, Dec. 3: The Trustees of the Idaho met last Monday at the Company's office, Findley & Co's. bank, and declared the 53d dividend. This dividend is $15 per share of capital stock, or $46,500 for the whole. The underground condition of the mine remains unchanged, a large ledge of rich pay ore constantly presenting itself to the miners. The next dividend will be light, as taxes, annual repairs and other extraordinary expenses will occur this month.

Magenta.—The west drift is in 250 and the east drift 70 ft. All the openings are in good ore, with a well-defined ledge. In a few days a second level will be started. Ground was first broken in the Magenta on the 23d of last August, and all must agree that Superintendent King has been doing energetic work. The Orleans mill (Smith's) is now crushing Magenta ore, and at the last of this week a clean-up will be made.

Rich Quartz at Truckee.—Truckee *Republican*, Dec, 4th. A quartz discovery has been made here. The ledge is about five miles north of Truckee. It was discovered by A. Berg, while engaged in hunting cattle. The quartz contains free gold, which is plainly perceptible, and assayed in San Francisco $350 per ton. The ledge has been located by A. Berg, E. Allen, R. P. M. Greeley and T. C. Plunkett.

Montana Ledge.—Nevada *Transcript:* This ledge situated at Willow Valley, which has been worked by McFate & Co. for the past two months, is yielding excellent rock at the present time, and the ledge is increasing in thickness, averaging 20 inches. The last crushing paid $50 per ton; as the rock now being taken out shows more free gold and richer sulphurets, it is estimated that the next crushing will pay from $65 to $75 per ton. About 35 tons of quartz are now on the dump pile waiting to be milled.

PLUMAS COUNTY.

Starten Up.—*National*, Nov. 29: The North American, at Hepsidam, are putting on hands again. Work in this claim was suspended last spring, but active operations will soon be commenced again.

Struck It at Last.—We are informed that the Mountaineer Co., whose works are located at Weldon Ravine, Onion Valley, in this county, have struck the pay level at last. This company have expended thousands of dollars and spent nearly fourteen years prospecting for the pay channel, and we are happy to learn that their efforts have at last been crowned with success.

Paying.—We are pleased to hear that Atherton & Co.'s claims on Shoo-fly Flat are proving very remunerative, and are likely to continue in the "same vein" for years.

Wolf Creek.—Mr. Patch has moved a portion of the machinery of the old Golden Gate mill to Wolf Creek, with the intention of putting up a mill on Burge & Co.'s ledge in the spring.

Dam.—The contractors on the new dam at Long Valley finished their contract a few days since. The dam is 600 feet long and thirty feet high.

SIERRA COUNTY.

Messenger Nov. 29: Wm. Picket, Supt. of the Rocky Point quartz mine, on the East Fork of the North Yuba, has just completed a substantial dam in the river a few hundred yards above their mill site. It will give them something over 30 feet fall.

Extensive preparations for gravel mining are being made at all the leading mines over north, which makes a "good haul" of dust about as certain as a rainy season visits the hills. Load after load of pipe leaves Laporte for the surrounding mines.

Mining.—Sid. York & Co. have located ground below the old Mt. Vernon mine, and will proceed to hydraulic it when water comes.

Running Light.—The Butte's quartz mills are working but few hands, comparatively speaking, owing to the scarcity of water. When more comes, a full force will be put on again.

Arizona.

YAVAPAI COUNTY.

Vulture. — *Miner*, Nov. 8: The vulture mine and mill may be put in paying shape again. J. D. Cusenbery, a former superintendent, is endeavoring to get the property ready for European capitalists, who propose to take hold and work it as it should be.

The quartz and placer miners are hard at work in Weaver and Walnut Grove districts. In the latter Henry & Smith are working Rainbow ore in arrastras; C. B. Genung is working ore from the Montgomery; Mr. Lonteria is crushing out of the Providencia, and all with paying results.

Goodwin & McKinnon, of Bradshaw, on Saturday last, searched the bottoms of their two arrastras and found twelve hundred dollars in gold—the product of eight tons of War Eagle ore.

On Upper Lynx Creek, Shelton and others are sinking on their lodes and working the quartz, while placer miners are making very fair wages.

It is said that J. W. Swilling and others will soon construct arrastras on Black Cañon creek, with which they design working ores from some ledges in that vicinity.

Colorado.

Colorado Central.—Colorado *Miner*, Nov. 27: We walked up the other morning and proceeded to interview Mr. Weaver, the Superintendent of a rich mine on this lode. We entered through the tunnel of Messrs. Robinson & Hurd, who are working a portion of the lode east of that operated by Mr. Weaver and his partners, and found their miners taking down a good body of mineral. The Weaver mine is well worked, the mining being done in a good style. We went through the different drifts east and west in the 200 feet they are working, and found everything in good shape. One peculiarity of this mine is that it is not troubled with water anywhere, being entirely dry. At both ends of the lower level good veins of mineral appear, and there is a large body of stoping ground nearly ready to be operated. A good ore-house covers the shaft, and several men are kept busily engaged in sorting the ore as it is hoisted from the shaft.

The Briggs opened this morning with a full force of workmen.

The Colorado Central mine has produced, since the first of March last, about $80,000.

Idaho.

Items—*Avalanche*, Nov. 29: Our mines are all looking well as usual, and we have nothing new to report concerning them this week.

The new engine and steam pumps of the Mahogany mine are now ready for operation.

Doc. Lowe, formerly of Eliot District, arrived last Saturday from the Willow Creek country, where he has been for the past three years. Doc. says that the Willow Creek mines are played out, and proposes to make Silver City his permanent abiding place.

Lower California.

Japa.—San Diego *World*, No. 27: A prospecting party is organizing to explore the Cocopah mountains, which are known to be rich. Mr. Jacobs himself will head the expedition to explore a region some distance below Japa, in Lower California, where gold and silver both are said to be very plentiful. Mr. Harry Pyler, a United States revenue official on the border, assures us that the mines are good. He encountered, near Milquatay, five peons who had washed out $80 in gold in two days, near Japa. We were yesterday shown by Mr. Spence, the Cashier of the Commercial Bank of San Diego, a quantity of retorted gold from Japa, which the bank had purchased. It is of a very fine quality, and Mr. Spence believes that the country from which it came will show some interesting developments. Large quantities of gold are coming in every day.

Montana.

Cherry Creek.—*Montanian*, Nov 26: Cherry Creek is coming up. The tunnel in the Eberhardt, owned by Enselman, Manheim, Merk & Co., is in 110 ft., and has opened up the largest and richest body of ore ever struck in the district. The vein is nearly two ft. wide, and the ore pays over $100 per ton. They have now about 75 tons of ore on the dump.

New and extensive coal beds have lately been discovered at the head of Stinkingwater. Mr. Dougherty says in the new coal district there are forty acres of coal land for every man, woman and child in the county. Mr. Murphy is the discoverer.

Good reports are coming from the prospecting drain ditch of Hall & Co., at Mill Creek. The gravel prospects well, and the boys are encouraged. There is hardly a doubt but Mill Creek will pay to work, but it is very deep ground.

Hot Spring.—The Thomas & Co. Mill, Hot Spring District, started up last week, and runs, we are informed, elegantly. The ledges are looking well, and the miners have more faith in the quartz than they ever had. Hot Spring is coming on; she has got the metal at last to bring her out. Lown's Red Bluff still produces every week the regular 10 or 12 tons of $100 ore.

Nevada.

WASHOE DISTRICT.

Belcher.—Gold Hill *News*, Dec. 6: The amount of ore will be increased as soon as the capacity of the mills on the Carson shall warrant it. The main incline is down 196 feet below the 1,300 ft. level. The drift running southward on the 1,300 foot level is in 503 feet, still in quartz. The company expect to make communication between the 1,300 ft. level and the main incline inside of 30 days. The winze starting from the 1,200 foot level is down 121 ft. All of the various stopes and breasts throughout the mine are looking well and yielding their usual amount of high grade ore. The prospects at the lower levels never looked so well as at present, the ore body holding out better and farther to the southward than was anticipated. The dividend of $5 per share, declared yesterday, aggregates $520,000, leaving a heavy surplus in the treasury.

Consolidated Virginia.—The main shaft is down 100 ft. below the 1,200 ft. level, the bottom in ore mixed with porphyry. Opening a new station for the 1,300 ft. level will be commenced immediately. The raise on the ore body is up thirteen sets of timbers (78 feet) in hight, at which point the ore body not only retains its full width, but the quality of the ore shows an improvement. The north winze, on the 1,200 ft. level, is down 113 ft., the bottom in ore of a richer quality than any heretofore encountered. The south winze, on the same level, is down 57 ft., and also in good ore. The machinery is all in splendid working condition, the new additions to the main hoisting works building are all completed, with the exception of the assay office and smelting rooms, and the future prospects of the company appear more flattering every day.

Crown Point.—The main south drift, on the 1,500 ft. level, is making steady though slow progress, the ground being so soft as to continually require the driving of spiling ahead, and the water from the face so intensely hot as to make it almost impossible for the miners to stand the great heat and perform their work. The middle winze, from the 1,300 ft. level, has made connection with the north drift on the 1,400 ft. level, giving a fine circulation of good air, cooling off the level and greatly facilitating operations in that portion of the mine. Sinking the south winze is making good progress, the bottom still in fine ore. The ore stopes and breasts on the 1,200 and 1,300 ft. levels are looking well and yielding finely. Daily yield, 400 tons of ore. The mills on the river running up to their full crushing capacity, and the future prospects of the mine flattering.

Chollar-Potosi.—The main south drift at the third station is fast approaching the ledge, the face in quartz of a promising character. The indications are excellent for the development in that part of the mine of a valuable deposit of ore, which will be a matter of much importance, having heretofore remained unprospected. The raise from the third to connect with the second station is giving a fine circulation of good air. The ore breasts in the ore-producing sections of the mine are both looking and yielding well. Three mills are now running on ore from the mines, and the future prospects look bright and flattering. Daily yield, 130 tons of ore, assay value $30 per ton.

Justice.—The north drift on the 300-foot level is still driven ahead, following the ore body, which is looking finely. The winze in the main south drift on the 400-foot level is down 60 feet, at which depth a cross-cut has been started to tap the ore vein. The extraction of ore from Waller Defeat shaft has been suspended, the ore dumps all being full and the teams being unable to haul it to the mills as fast as it is taken out.

Gould & Curry.—There is nothing new to report of the ore extraction from the old upper levels. The main east drift, on the 1,500-foot level, is still driven vigorously ahead, the face in low grade ore mixed with quartz and other vein matter. The main east drift, on the 1,700-foot level, is in 88 feet, passing through the west wall of the ledge with good indications of soon reaching the ore vein.

Sierra Nevada.—Daily yield 65 tons, keeping the company's mill steadily running. The ore breasts are all looking finely. The prospecting drifts in the old Sacramento ground have shown considerable improvement in the quality of the ore developed during the week.

American Flat.—The main southwest drift, at the 400-foot level, showed a decided improvement during the week, and there is but little doubt when cross-cutting the ledge shall have been accomplished that a paying mine will be developed.

Succor.—Sinking the main shaft progresses as well as usual, and the drift east from the little shaft in the ravine east of the mill still follows the vein, developing excellent pay ore. The mill has started up working this ore.

Savage.—Sinking the main incline is making good progress. The east cross-cut from the main north drift is still driven ahead.

Nevada.—The raise from the main south drift, 130 feet south of the main west drift, is up 20 feet, the entire distance in excellent milling ore, which needs no assorting whatever for milling purposes. The ore carries a large proportion of free gold and will be easily worked in the mills. The distance from the tunnel to the surface is 100 feet, and it is expected this chimney of ore will reach nearly to the surface, making a valuable development.

Silver Hill.—Another eight inch pump has been put in place to assist the one already in operation, and it is now expected that the two will soon drain the water so that work can be resumed in both the shaft and main south drift.

Dayton.—The mine is looking well throughout; both the second and third station levels are yielding the usual amount of good milling ore. The ore dumps are full, and the company are shipping 40 tons of ore per day to the Woodworth mill on the Carson river, which they have leased, and we hope soon to have the pleasure of placing the Dayton on our list of bullion producing mines.

Julia.—The water in the shaft is being steadily lowered, being now reduced to within about 25 feet of the 1,000-foot level. The main southwest drift on the 900-foot level is being driven ahead five feet per day, with excellent indications of a fine body of milling ore.

New York Consolidated.—The new pump lowered to the 250 foot station, is working finely, and with the aid of the tanks will soon reduce the water in the shaft to the 400 foot station. It is expected that the pump can be lowered to that station by Monday next.

Imperial.—Sinking the main incline is making good progress, notwithstanding the rock in the bottom blasts quite hard.

Alpha.—Driving the main north drift on the 1,700 foot level is making steady progress.

Europa.—The work of opening out this mine goes on vigorously.

Knickerbocker.—The erection of the new machinery and hoisting works is making good progress.

Hale & Norcross.—The main incline is down 232 feet below the 1,700-ft. level in hard blasting ground. A small quantity of ore is being extracted from the second and third station levels, which show no change of importance.

Ophir.—The prospecting drifts south, on the 1,700-foot level, have shown some little improvement during the past week.

Caledonia.—The work of erecting the new boilers and putting in the new combination brakes is completed, the cables run on the reels and work resumed in the mine. The new pump is hoisting water at a single lift from the 500-foot station and working splendidly. Driving the new drain tunnel is making steady progress.

Arizona, Utah and Globe.—The main west drift at the 400-foot station is in 195 feet, the face in vein matter of a much softer formation, indicating a close proximity to the main ledge. The south drift from the incline is in 48 feet, the entire distance in ledge matter, mixed with spots of good ore.

Baltimore Consolidated.—Sinking the shaft is making rapid progress. It is now down 110 feet below the third station, in good sinking ground.

Utah.—The main west drift at the first station is in 200 feet, progressing at the rate of five feet per day. The rock is quite soft, with some water flowing from the face, though not enough to impede the progress of the work.

Overman.—The main drift on the 1,200-ft. level is still driven ahead. The several cross-cuts and prospecting drifts on the 1,100-foot level are making the usual good progress.

Daney.—The main shaft is down 170 feet, the ground in the bottom working finely and excellent progress being made. There is no water to impede the prosecution of the work.

Yellow Jacket.—Main incline down 49 feet below the 1,500-foot level, and good progress made in sinking. Cross-cutting at the 1,400 and 1,500-foot levels going ahead as usual.

OPHIR DISTRICT.

The Monarch.—*Tribune*, Nov. 13: Is owned by Godbe, Lawrence and others, and lately bonded by Lothian & Co.; has under their experienced management, disclosed a fine body of rich ore, and this company is about to commence shipments to the Camp Floyd mill.

Nothing is being done on Silver hill except the shipment of ore from the Silveropolis. Work has just been commenced on the Silver Reef, on Chloride hill—with this exception, that hill has been vacated, probably for the winter.

Gray Rock.—This has been worked until within a day or two, but the failure of the purchaser to make his payments, either for the mine or for the work he has been prosecuting on it, has caused a temporary suspension of its development.

The Sacramento.—Is developing finely, and promises to equal the Chicago and Hidden Treasure.

The Mills.—Walker's mill is running, Robinson's arastra, Bliss' arastra and the New Jersey works, also. The cold weather, by and by, will compel most of them to shut down for two or three months. There is a probability, however, that work on most of the mines will go ahead through the winter, with a slight reduction of hands. In the spring things will be pretty lively, for there is great preparation to take up locations which have been forfeited, or will be, at the time limited by the mining law for working the required assessments.

Scenes in the High Sierras.—Yosemite.

[Written for the PRESS by J. G. LEMMON.]

An English traveler, a member of the celebrated Alpine Clnh, who spent seventeen daye in Yosemite, upon leaving declared to Mr. Hutchings: "I never left a place with so much pleasurable regret in my life. I have several times visited all the noted places in Europe and many that are out of the ordinary tourists' round. I have crossed the Andes in three different places and been conducted to the sights oonsidered most remarkable. I have been among the charming soenery of the Sandwich Islanda and the mountain districts of Anstralia, but never have I seen so much of sublime grandenr, relieved by so much of engaging beauty as that I have seen in Yosemite."

Yosemite in Detail.

Here, at the outset, gleaming through the trees on the south, is the entrancing Bridal Veil fall, wreathed with rainbows by the declining sun, and swaying in long, fleecy folds from side to side of its wide, age-hewn cavern. It is generally called by its beautiful Indian name, *Po-ho´-no*, a name rendered doubly interesting by its pertinent meaning, "Spirit of the Evil Wind." This refers to a legend ilustrative of the traditions of the red man.

Legend of Po-ho´-no.

The stream forming Po-ho´-no fall comes from a high lake many miles away, npon whose anrface a strong, gusty wind ever blows. The legend hath it, that "in the nnremembered days" this savage wind seized and threw several of the natives into this lake, from which they were dragged down by the turbnlent stream—the spirit of the wind—and hurled over this awful precipice. Modern accidente, with a similar result, confirm the tradition, and so affrighted Lo invests thie beautiful, innocent waterfall with the fascinating, seductive, destroying "Spirit of the Evil Wind." It is said the Indians regard it with horror; hurry past it on the further side; believe pointing towarda it wonld be death, and could not be hired to pass a night near it, as then in the stillness they hear the voicee of the victime warning—"Beware of Po-ho´-no." This legend but intensifies interest in this favorite of tourists, and illustrates the pertinence of the Indian names attached to every prominent object in and around the valley, but while we syllable the soft, euphonious, appropriate, aboriginal names, we cannot, for want of space, in each case, give the legend.

Thia waterfall of *Po-ho´-no*—this epitome of Yosemite—is 940 feet high, (15 feet higher, and with mnch more volume than Staurhach—the highest and most famous cascade in Europe). To get an idea of that vast distance we must diemount, clamber up those ragged rocks for half a mile, and stand, perhaps, in its spray with rainbowa not larger than cart-wheels aronnd us; then look up a little way at a time, and drink in the great hight and marvelous beanty of this swaying, folding, rippling, tinted cloud of water rockets flying down out of the sky.

Resaming our ride in about a mile we find ourselves in the narrowest part of the valley—the gateway to the Gallery proper—occaeioned by the mutual approach of two massive, towering, vertical rocks—gateposts to the wonderful park within. The north one is the magnificent rock

El Capitan or Tu-tock-ah-mu´-la.

This sheer, bold, beetling, immense bluff of almoet smooth granite, is over a mile wide, and nearly two-thirds of a mile or 3,300 feet high. Happening to etand fairly in eight of most of the valley, itie a chief attraction, especially when gloriously illuminated an honr or two before any other point by the morning sun. The Indian name ie that of the great chieftain or semi-deity of the valley. The legend relates that before *Tu-tock-ah-mu´-la* was driven by dispair (hereafter to be related) from his throne on the top of this rock, he carved his noble form on ite outer face. and to this day the tonrist sees a oolossal full-length figure there, 2,000 feet high, but wearing the modern dress and etern featnres of Gen. Jackeon! *Tete-a-tete* with El Capitan are

Ths Thres Graces or Wa-wa-le´-na.

These spurs of granite overlapping each other are 3,750 feet or nearly three-fourths of a mile high; the inner one continuing vertically down to the floor forme the south gatepost or guard. The euphonious Indian name signifies "Leaping Bears." Passing the gate where no forbidding porter stands, we are conetrained to take a firet sweeping glance along each side of the wonderfnl gallery to note the arrangement and general effect; then, returning to the inspection and looking back to the rocks last described, they present a very different contour—that of an immense cathedral, receiving a new and expreesive Indian name, *Poo-se-na-chuck´-ka*, "Big Acorn Storehouee." It is said that its resemblance to the wonderful Milan cathedral is very marked, though vastly larger, as the latter is but 480 feet long and 355 feet high.

Continning on a mile from the gate we are opposite, on the north, the

Thres Brothsrs—Pom-pom-pa´-sus.

These lofty spurs overlap each other like the "Three Gracea," and like them take a very different ehape and a new name from an upper view, "Eagle Point" and Indian *Hum´-moo*, "Lost Arrow." The first Indian name *Pom-pom-pa´-sus*, by which they are generally known, meane "Falling Rocks," and correctly describes their appearance—eeemingly in imminent danger of falling from their lofty perch of 3,700 feet, nearly three-fourths of a mile.

Continuing the inspection of the walle on the eouth, back of the hotels, we eee firet, if in the spring months,

Sentinel Fall—Loy´-ya,

The Indian name means "Medicine," but we must omit the legend. This ie not properly a fall, as the rock is not vertical, and the water slides in places from the greatest hight known to travelers, 3,200 feet,—nearly two-thirds of a mile,—in a beautiful, nrrrow, ribbon-like, quivering, glittering casoade to its basin on the floor of the valley, but it ceases to flow about the first of June.

Close beside the cascade, on the east, shoots up the spire

Sentinel Tower—Loy´-ya.

This white, bristling shaft, elevated 70 feet above the cascade to which it gave its name by its great hight and central position, was eminently fitted for the use the Indiane made of it, to kindle beacon lights upon. What meesages of warning, of invitation; what tokens of arrival or departure, or what sacrificial flames have ascended from this watch-tower in the ages when the red men numbered millions, instead of thousands, can only be imagined.

Opposite Loy´-ya, on the north, a mile and a-half across the widest part of the valley, there was placed by the Great Architect of this colossal gallery a landscape scene compricing so many picturesqne surroundings, setting off such a splendid central object, that it ie no wonder that the Indians gave its name to all the valley, or that every hotel, private reeidence, hnsiness place, even every stahle and camper's tent is placed facing it.

Great Yosemite Fall.

This world-famons triple cataract—the highest constant waterfall known—is set in a massive, granite, heavily moulded, euperhly painted frame, over 3,000 feet high. Its three sections, onc above the other, at a dietance look like three white feathery comets chasing each other np the precipice. A nearer view separatee it into two lofty cataracts, conneoted by a cascade. The first or lower cataract ie 434 feet high. The connecting cascade ie 600 feet in vertical hight, receding twice as far to the pool at the foot of the upper cataract, which falls from the great hight of 1,600 feet, or the total elevation above the valley of 2,634 feet, only six feet lese than half a mile.

On account of the large size of the stream, these two falle are properly termed cataracts, and the quiet beauty of lesser falls becomes awful grandeur here. Each cataract has worn for itself huge caverns in the face of the overhanging rock, and the visitor can hear and see the work going on, as the strong wind that falling water alwaye produces, drives the long column of whitening, plunging fluid now on this side, now on that with a report that may be heard for miles. At times the wind becoming reflexed in the caverne, puehes up, scattering the deep and hroad sheet of water into finely commiunted spray like an immense fountain; wheu, if the morning sun is shining the most brilliant display of rainbow rings, bande, flames and jets are eeen blending, changing, expiring and reappearing again in a transforming scene so gorgeous as to be excelled by nothing less than an Aurora in high latitudes.

In winter it is said, these cataracts, increased fonr-fold, present some terrific phenomena. "Large quantities of ice form each night at the side of the fall, and, being nearly opposite the east, the morning sun soon loosens them, when they fall with a loud boom and the opposing walle catch and re-echo the sonnd until the whole valley is enlisted in the grand chorus. In winter too, the falling water gives euch momentum to the contiguous air that a perfect tornado is experienced in the vicinity of the base of the upper fall, and when snow is falling so much is drawn like a funnel into this gorge that it forme at the base into masees of enow and ice 300 to 500 feet thick. When the spring thaw commences the large stream playing upon this mass soon wears a hollow from which it rebounds 500 to 700 feet high, then falling dissolves into epray upon which the sun paints pictures the most bewilderingly beautiful of anything in Nature."

Leaving Yosemite falls in all their varied attractione and passing on about a mile we find the valley trending a little to the southward, and ourselvee opposite, still on the north, the singular rock-cleft

Royal Arches.

They are formed by the falling away of the wall of rock in a singularly arched form 1,800 feet high, with a epan of 2,000 feet, and a depth of 80 feet. This huge niche wae evidently deeigned by the Architect for a picture frame, but its vast eize, probably, prevented its occnpation. The only figure that would be commensurate with thie enormous frame was wrought by the same artist, and that is old *Tu-tock-ah-mu´-la*, now suspended on the gate post, but he would have to be cut off at the knees. Solomon might have used it as the trestle-board upon whioh to draw the plans of his temple full size, and Noah might have represented his ark upon it, for, according to Archbishop Usher, the Ark wae 150 fathoms in circumference—only about four times as large as a first-class modern man-of-war. But the posterity of Noah, the founders of the unparalleled city of Babylon, erected structures too lofty to be placed in this niche.

The Tower of Babel and Temple of Belus, or Nimrod, were, according to Diodorus, 7 furlonge of 500 feet each, in hight—equaling 3,500 feet. Admitting their fabulous dimensions these ancient structures if etanding in Yosemite valley, would just reach up even with its encircling rocky spurs.

We are evidently in the unfurnished portion of the gallery now, for right across through the thin woode on the south side, is a smooth, perpendicular, lofty wall of granite, shaped like an ellipse divided longitudinally; the upper edge 3,705 feet, or nearly three-fonrths of a mile high, and the base about a mile and a half wide. This is called glacier rock or *pam-pa-lu´-na*.

The appropriate Indian name means "Hanging Bear Skin." This extensive surface, deeigned, perhaps, for a landscape scene, only received the priming colore by the artist, faintly limning the ontlines of the streame, forests, vistae, oaetles, mammoth animals, etc.

Upon this immense ice-ground bristol board, might be sketched, full size, a large number of the most stnpendous works of man of which we have accurate knowledge.

A Colossal Picture.

In the center of the baee might be placed the eupposed ruin of the Tower of Babel—now a vast mound called by the Arabs Mujelihe, meaning "the overturned," a basis of solid masonry, surmonnted by a maes of debris of very ancient kind of building material, sufficient for an enormoue strncture—fully eqnal to its traditional dimeneions. The mound is about 2,000 feet around and 320 feet high.

On the right of our picture we might place the Pyramid of Cheops, 720 feet on each side, and 448 feet high.

Similarly placed on the extreme left, the Pyramid of Cephrenes, 655 feet square and 398 high.

From Cheops to Mujelibe might be constructed the high bridge of the Croton Aqueduct over the Harlem river, 1,460 feet long and 114 feet high. Similarly from Cephrenee the Britania Tubular Iron Bridge over the Menai Strait, 1,831 feet long and 100 feet high.

Under the Aqueduct Bridge might be excavated the great tunnel nnder the Thames at London, with true proportions.

For one of the central piers of the Britania Bridge, the Pharoe beacon or light tower of Alexandria might be substituted.

On the debris of Mujelibe might be placed the largest vessel ever built, the Great Eaetern, 700 feet long, 118 wide, and 70 high, with the Atlantio cable 4,000 milee long coiled on board, and ite 6 masts made of California "Big Treee" 150 ft. high.

On the flattened apex of Cheops, the terrible man of war Minotanr, with its armament of 120 guns and crew and marines of 2,000—the vessel being over 500 feet long.

Similarly on Cephrenes the invincible ironclad monitor, Dunderberg, 378 feet long.

For paesengers on each, Jupiter Pluvius, a brick and stone statue 50 feet high in a couching attitude, might sit on the bow of the man-of-war, the Egyptian Sphinx, made of eolid rock 60 feet high and 150 feet long, might kneel upon the upper deck of the Great Eastern and the hronze statue Colossus of Rhodee, 125 feet high, might stand with one foot on each of the turrets of the monitor.

Over the aqneduct bridge might be placed without interference with the vessele named, the Washington Capitol and the Smithsonian Institute—the former 751 feet long and 300 feet high; the latter 450 long and 140 wide.

Similarly over the Tubular bridge the Strashurg Cathedral and St. Peter's at Rome—the former 530 feet long with an unexoelled spire 474 feet high, the latter 721 feet long, with a spire 432 feet high.

High over the "Big Tree" masts of the Great Eastern, for a center piece of another eet of enormoue structnres, might be placed the Roman Coliseum, an elliptical amphitheater 620 feet long, 513 wide, and 157 high, covering 6 acres and capable of holding 110,000 persone.

In mid air at the same hight, over the capitol and the inetitnte, could be represented the London Crystal Palace, 1,851 feet long, 456 feet wide, 108 feet high and covering 18 acres.

Similarly over the two cathedrals, the twice as large Paris Exposition building, 1,500 feet long, 1,245 wide, 85 high, and covering 35 acres.

On either side of the Colieeum, and between it and the Cryetal Palace, might be erected the Buuker Hill monument, 221 feet high; aud the Porcelain Tower at Nankin, 200 feet high.

From monument to tower, high over the Coliseum, might be stretched the Niagara suspenoion bridge, 800 feet long and 200 feet high.

In mid air over the London crystal palace, might be placed the church of the holy sepulchre at Jerusalem, in the form of a cross, 320 feet long and 70 wide.

Similarly over the Paris palace, the magnificent Mausolenm of Taj Mahal at Delhi, British India.

FASHION AND FIRE.—Only lately Mrs. Archer Clive—the gifted author of "Paul Ferroll"—perished by fire, and now another lady hae died in the eame frightful manner. It seems strange that none of the devicee for making ladies' clothing incombustible have come into general use. About a year ago, an incombustible starch was muoh talked of, was severely tested by scientific experts, wae generally approved, and hes never been heard of since. It is too bad that ladies should die an agonizing death, when means exiat for rendering theee deplorable accidents absolutely impossible.—*Iron.*

The Globe Iron Works.

The Stockton *Independent* gives the following account of the Globe Iron Works in that city. The Globe Foundry, subsequently named the "Globe Iron Works," was founded by E. I. Keep and W. H. Briggs in 1858. This firm firet got up steam and started the works on the 15th day of April of that year. Both gentlemen came from Marysville for the express pnrpose of starting the foundry business in this city. The principal work of this establiehment, up to 1863, was mining and milling work, and building enginee, doing nearly all the milling work for the southern mines, at that time extensively carried on in the counties of Mariposa, Tuolumne, Calaveras and Amador. The work for the Mariposa mines was very extensive—furnishing and putting up the machinery of several large mille, with enginee and hoisting works—both of Mariposa and Coulterville. They furniehed the engine and hoisting worka for a mine at Jamestown, Tnolumne county; also a large amount of machinery for the mines above Sonora. A considerable amount of machinery was manufactured expressly for mines at Angel's Camp, West Point, Chile Gulch and various other pointe in Calaveras county. There was likewise furni hed from the eame eource quite a large amount of costly machinery for the Union and Keystone copper mines in Salt Spring valley. The engine and hoisting works for the Sutter Creek mills were also manufactured at thie foundry.

In 1864, Mr. Keep purchased the interest of his partner in the concern, and conducted the bnsiness himself until the time of his death. Mining work continued to prevail, occasionally small ordere being received for plow-pointe, plow standards, etc. During the time the eetate was in the hands of the administrator of E. I. Keep, the bueiness was continued and conducted by W. H. Keep, who finished up all contracts and executed such other work ae was called for. W. H. Keep and Thomas Blake formed a copartnership and the bueinees wae conducted for several years in the name and under the control and management of Keep & Blake. The character of the work varied but little and there was neither any marked increase nor diminution in the amount of work turned out. The work chiefly consisted of milling machinery, hoisting works, mining pumps, etc.

In August, 1865, a new member, Peter Bargion, was admitted to the firm. In subsequent years the bueiness annually amounted, in the aggregate, from $75,000 to $80,000. Work for the mines soon became slack, owing to the falling off in mining pursuits. In 1866 an engine was built for the City Mills, owned by Sperry, Burkett & Co., and machinery for steamboats and agricultural implemente kept the foundry husy and counterbalanced the falling off in the demand of such machinery ae they had previouely furniehed to the mining companies. That year (1866) a quartz mill was furniehed a Mr. Conrad. The business of the year aggregated about $80,000. In 1867 engines were built for the steamers Tulare and Pioneer; also for Wagner & Bro.'s tannery; also for Coffey & Riedon; aud the same year a contract was entered into by which the proprietors of the foundry commenced the manufacture of Root's blowers. The first blower manufactured was sold to a party in San Francisco.

The manufacture of theee blowers has become quite an important feature in the business of the concern. They are not only used where blasts are required, but are in exteneive use in ventilating or forcing freeh air into deep mines in Nevada. The proprietors of the Globe Iron Worke have the exclusive right for the manufacture of this machine on the Pacific coast.

During this year Mr. Blake sold out to Keep & Bargion. In 1868 the business aggregated $140,000. There was built a stationary engine, 20 by 24; aleo, machinery for the steamers Colusa, Hope, Clara Crow, T. C. Walker, Empire City, Chin-du-Wan and Harriet; also a stationary engine for Sherman, Cook & Co. Machinery for the steamers Tuolumne City, Ellen, and a quartz mill for the Confidence mine were constructed in the year 1869, and the balance of the year wae chiefly confined to the manufacture of the Root blower, pumps, horse-powers, agricultural and houee fronte. Business slightly fell off in 1870, the aggregate not exceeding $75,000. In addition to local work this year, machinery was manufactured for the steamer Merchant, built for the Amoor river, the Emma, and one etationary engine, 24 hy 48. The business fell off considerably in 1871, $65,000 or thereahout being the sum total. During the last and preseut year the work has coneisted principally of the manufacture of Keep'e pump, of which we made mention some time ago, and horse powers, blowers, etc., and the necessary castinge and iron work for headers and agricultural ware for Baxter, Webster and others. The number of men employed at the preseut time is eighteen, althongh at timee as many ae twenty-five are employed. The Globe Iron Worke are situated corner of Commerce and Main streete, and are exactly one block from the water front. Probably not less than the sum of one million and a half of dollars hae been handled in conducting the husinees of thie small, but compact and efficient eetablishment alone, or an average of $100,000 a year since it was founded.

TO REMOVE MARKING INK.—Wet the etain with freeh solution of chloride of lime; and after ten or twelve minutee, if the marks have become white, dip the part in solution of ammonia (the liquid ammonia of chemists,) or hyposulphite of soda. In a few minntes, wash in clean water.

Useful Information.

Punching Holes in Straps.

The punchiag of holes through the various strape of a harness, for bnckle-tougnes aad for attaching the bnckles, is a matter of considerahle importance, aad does not, as a rule, receive the attention that it should. The old method of punching thom, from the upper or grain side of the leather, has heen very generally abaudoned by the mannfacturers of fine work, it heing deemed injurious to the wear of the leather. The principal objection arises from the liability of the grain of the leathor to crack from the strain on the buckle-tongue, and to be the cause eventually of the leather tearing, as it causes such a crease where the tongue catches that it injures the textnre of the leather aad makes it tear the hole more or less. In addition to this, if the leather is very strong the tongue of the buckle is sure to he bent out of shape. All these objectious can be obviated hy punching from the under or flesh side of the strap, and by nsing punch, the long sides being parallel with the leagth of the strap, the punch shonld bo set at an angle of about twenty degroes, cntting the holo at such an angle that the bnckle tongno will rest in it without throwing any strain on the inside of the leather.

Some object to punchiug the hole from the uader side on account of its forcing the grain ont, and thns disfignring the oatside edges of the hole; this can be corrected, however, by driving the pnnch throngh the hole from the ontside, which will cut away the slightly tnrned edgo of the grain, and set it down smooth and olean. It is not necessary, however, to repnneh any holes except those that will be exposed when the harness is complete. Punches should be as thin as possible, as the extra thickaess of the metal straias the leather. —*Harness Journal.*

Drawing Screws.—Few things, says an exchange, are more vexatious than obstinate screws which refuse to move, much less to be drawn out; and in the struggle against screw driver power snffer the loss of their heads, like conscieatious martyrs, rather than take a single half tnrn backward from the eourse they have followed, and from the position they have beea forced into. Like obstinate children, they mnst be coaxed, or rapped pretty hard on the head, according to circumstances; ia fact, whoever has a tight, obstinate screw to "draw ont," must keep his temper down and his resolntion np qnite as much to the sticking point as the screw does. If the screw is turned into iron and not very rusty, it is only necessary to clear the head with the wedge of the driver, and let a few drops of oil penetrate to the threads; but, finding that excessive heat or rust has almost fixed the screw immutshle, then heat, either by placing a piece of hot iron upon it or directing the flame of the blow pipe npoa the head, and, after applying a little oil, tnrn out gently; but care must be taken not to let the tool slip so as to damage the notch. If, however, the screw refuses to come out, try to force it back with a blunt chisel, smartly hut carefully tapped with a light hammer; but if evidently nothing can dislodge the enemy, it is best to cut the head away and drill out the screw. When an obstinate screw happens to he in wood, merely give it a few taps on the head; hut failing in that, heat it with a piece of hot iron, when it may he easily turned.

To Destroy Field Mice. — Smoke, it is well known, will soon destroy these little pests, but how to introduce it into their holes ia an easy wsy may interest some of our readers. Professor Nessler, of Carlsrnhe, has devised a sort of pellet which gives off great quantities of smoke whea huraing, so thst it is only necessary to put some of these into the holes and ignite them in ordor to suffocate the mice. Their preparation is nearly as follows: Some fibrous substance, such as jute, is soaked in a coucentrated solution of saltpeter, dried, then dipped in tar, and, when half dry, flowers of sulphur are sprinkled over it. When fully dry, the jute fibers are cut into little pieces, like pills, and are ready for nse. As soon as they are ignited they are stuffed into the hole, which is then stopped up with earth. Could not this method, or some modification of it, he applied to the purpose of destroyiag those great enemies of our farmers, the squirrels? Strangling by sulphur fumes, if practicable, would he far less expensive than poisoning hy phosphorns or strychnine.

Dyeing Sheep Skins.—Unslacked lime and litharge, equal parts, mixed to a thin paete with water, will color huff—several coats will make it a dark brown—hy adding a little ammonia and nitrate silver, a fine black is produced. Terra Japoaica will impart a "tan color" to wool, and the red ehsde is deeponed hy spongiag with a eolution of alum water to "set" the colors. One part crystalized nitrate silver, eight parts carhonate ammonia, and one and one-half parts soft water, dyee hrown—every additional coat darkene the color until a black is obtained.

Glycerite of lime nsed in hurns ie said hy De Breyne to soothe the pain and prevent inflammation or diminish its intensity; it is prepared from recently slacked lime, one part; glycerine, fifty parts; chlorinated hydrochloric ether, one part.

Restoration of Oil Paintings.—It appears that the hrilliancy of the colors in oil paintings is due to the optical properties of the substance contained in the oil, kuown as linoline. By exposure to the air, this substance, at first liquid, absorbs oxygen, becomes solid and transparent, firmly enclosing the particles of color. Linseed oil contains 80 per cent. of this linoline. By lapso af time and physical and chemical changes, the linoline loses in some degree its transparency and the picture fades, those colors containiag the least oil changiag most. Pettenkofer has discovered that the vapor of alcohol will renew the qualities of the linoline, and he restores old oil paintings by placing them over a tight box, in the bottom of which is a flannel cloth, which has heen dampened with alcohol of 80 per cent. strength. The arrangement shonld be such that every part of the picture will be exposed to the alcoholio vapor.

Removal of Oily Matter from Wool, Etc., by Hynao-Caanon Vapor.—According to Simonin and Coffia, hy passing vapor hy any of the light hydro-carboas produced in the rectification of petrolonm (as naptha, otc.,) through wool, horse-hair, feathers, etc., placed on suitable open frames, it will take np the oily matter and retain it in solution after condensation. By distilliug this solution, and either passing the vapor through fresh portions of wool, etc., or condensing it, the oily matter is left as a residue, which can be purified aad utilized. Treatment with vapor is more effective than with liquid hydro-earbon, siuce it comes into more intimate contact with the suhstance to be purified.

What Oil to Buy. — Do not hny dark or very white kerosene—the light yellow is safest. Lamps with "sun hurners" economise the light most. There is a patent hanging lamp fasteuod to the ceiling by a strong, coiled brass string, which can be pushed up or pulled down to any hight at pleasure The apparatns is durahle. Such a lamp is nearly as coavenient as gas, and is ehcerful over the teatable or work-tahle.

To make tracing-paper, castor-oil is mixed with three or four parts of absolnte alcohol, and the homogenoas mixture spread over the paper with a brush. After the drawiag is made, the paper may be washed with alcohol, aad will return to its original condition.

Domestic Economy.

Farm House Chat.

[Written for the Press by Mary Mountain.]

A sweet young lady with thonghtful blne eyes snd cheeks like roses followed me into the kitchen and said:—"Mrs. Mountain, I should really like to cook if I could do it easily and quietly like yon; hut I dirty all the dishes, and danh myself from head to foot with dongh, and cut my thnmbs aud burn my fingers, and scorch my face till it hlazes; and perhaps the things won't he very nice after all."

But, my dear, they *will* be nice; and yonr own perserverance will finally make smooth sailing through the domestic "sea of tronhles." Our awkwardness disappears as we gain confidence and fiad in this as in other things that practice makes perfect. Now this is the way to make

The Graham Pie-Crust.

Sift the pan abont half full of flour, then make a hole in the center and dip in two cups of graham. Put in a little salt, a small teaspoonful of pulverized soda, and ruh in thoronghly a heaping tahlespoonful of cold sweet lsrd or hutter. Then mix with a cup and a half of buttermilk and stir until the dough is stiff enough to mansge nicely with the hands; then knead it for a while and you caa soon tell when it seems just right and no longer sticky.

Now separate a portion, a little more than one-third; sprinkle flour on the hoard and roll this piece ont till about ¼ of an inch thick, and spread evenly upoa it with a knife ahout a spoonful of the lard or butter. Sprinkle flour thickly npon that, double over the sides, roll it up snugly from end to end and there you have your "upper crust." Using the fine flour freely upon the board you will find that both under and upper crust will roll out as nicely as any pastry; will not be very tough, will look well enough and *digest without a pang.* Plenty of cream in place of the lard or bntter would make a more truly "hygienic pie;" but the average stomach finds no fanlt with these.

The amount of dough just made will do for three or four pies, according to eize of plate; and oae soon learne to divide the dough and make all thinge come even.

"What shall I do to prevent fruit pies from boiling ont in the oven?"

Sprinkle a spoonful of flour in with the sugar and that will absorh and thicken the jnice somowhat, hut very much depends upon the arrangement of the crust. I roll the upper crust large enough to leave a margin all around the plate. Then having wet the edge of the under crust the two adhere pretty firmly, and the projecting margin ie neatly tucked under snd "fenced around" with a gentle pressure of fork-tines. A eliced apple pie requires long cooking, and if water is added in the make-up, it is very apt to break through the crust and away go the rich jnices into the oven, burning, emoking,—such a discouraging muss! So, if yonr apples are at all juicy, add no water until after the pie is baked, hut then as soon as taken from the oven iutroduce throngh a slit in ia the crust a few spoonfuls boiling hot. This I learned from good Aunty S——, whose deep, delicious apple pies are a "dainty dish, fit for a king."

"How mnch sugar onght I to pnt in?"

Well, that depends npoa the tartness of the apple with most cooks, but if not very sour I always add a little tartaric acid; for a flat, iasipid apple pie wonld upset the complaisance of Henry Ward Beecher and perhaps spoil a sermon! So you see how important that it should be tonod np.

"But everyhody is not so critical and epiourean as Beecher."

Yes, but we may as well have a high standard and work np to it. I have never forgotten his description of

"The Perfect Apple Pie,"

And since reading it, I have made several that I would not he ashamed to set before him; but as for letting him eat them all before they are qnite cool—that is a little too much for any well regulated woman.

Once a week ia winter and twice a week in summer, is often enongh to make pies when the housekeeper is also the honsemother, and striving to value jnstly the claims of sonls and stomachs, aad sll the clamorous rangs of duties at home and abroad.

"Do tell me just how the Beecher pie is made."

Oh, he conldn't tell himself how to make it! oaly *how it should taste*, aud the exalted sensations of a man slowly aad thankfully eating his way throngh a very hig piece of the perfect apple pie.

But this is my way. Lay the sliced apple upon the bottom crust until abont half is thus placed, then spread over a cnp of nice sugar, a large spoonfnl of flonr, a little dash of sslt, a slight sprinkle of nutmeg, several small lumps of butter, and if the apple is not very tart, a hit of tartaric acid as large as half a nutmeg—powdered of course. Then lsy on the rest of the apple; fix the npper erust carefully; bake rather slowly, with even, steady heat; add the hot water as a finishing touch, and the pie, cold or warm, will comfort the stomach if it cannot inspire the hrain.

"I thonght they needed a great deal of nutmeg."

No. I learned from Faith Rochester that a little gives delicate flavor like lemon, while a large quantity is simply coarse aad bitter.

"And now the brown hread, please, before I go home."

Yes, I must hurry thst up directly; it takes so long to bske. Making it so often I havo no need of an exact rule, but here is one for you if you like.

Brown Bread.

Three cups corn-meal, one cup graham, one cup fine flour, two-thirds cup syrnp, teaspoonful of salt. Mix with three cnps hnttermilk and one cup warm water, in which dissolve heaping teaspoonfnl of soda. Bake in moderate oven three hours, covering closely sfter the first hour, or after it is browned over.

I hake in a deep tin basin and put a stove-cover under it in the oven to prevent burning. The quantities of meal and flour may he much varied. Hslf corn-meal and half graham make a very good loaf, nerhaps the hest, when your corn-meal is ground pretty fine. But if cosrse corn-meal is nsed, the additiou of a little fine flour make the loaf cut more smoothly. If you have no graham, two parts corn-meal and one part fine flour, or middlings, will make excellent hrown hread.

"Why do you pnt so much water with the soda?"

Because if mixed wholly with hutter-milk the loaf is too tender and crumbling. Sour milk is not eo rich and if that is nsed there would be no special need for so much water. And if you like it sweeter than this (I mean if your father or—hushand?—would like it sweeter,) put in a whole cup of syrup, or ponr without stint or measure, like the woman who declared the minister's tea "would be none too good if 't was all 'lssses." After a little practice yon can make experiments and never fear spoiling the moist, ruddy, coarse loaf.

"And will this do just as well steamed?"

Yes, I think so; but my good Stewsrt stove bakes so nicely I have almost given up the steaming proeess. Covering the loaf protects the crust and the long-continned heat gives the rnddy color.

"Now I want to know one thing more. How can you always tell how much soda is needed? All the rules are snre to say a tesspoouful, bnt sometimes that is too much and spoils things."

We must learn, my dear, to

Cultivate Our Noses.

Stir np hriskly the huttermilk or sonr milk, and a gentle, critical "sniff" will tell us whether it ie elightly acid or very sour. If fresh and new, a pint of buttermilk will need about a hslf teaspoonful soda, while another pint a few days old would neutralize a heaping teaspoonful.

One must learn to judge of all degrees of acidity hy smelling or tasting, *and by careful observation of results.* If dry soda ie mixed with meal or flour it must he very finely powdered and thoronghly mixed. If dissolved in water or milk it must he added *the last thing*; then the batter well beatea is ready for the hot oven or griddle. Nearly all old cooks understand this; but beginners can "make a note of it."

Good Health.

About Fried Food.

We copy the following from a foreign paper because we believe there is a good deal of sense in it:

One of the first ecraps I light npon is one I picked up somowhere, evidently from an Amerioan newspaper, from the dishes mentioued, about the health of farmers. What singular combinations of odibles they make nse of in tho United States! This jotting, after assuring us that farmers ont in the west are not so long-lived as other classes, although under proper dietetic conditions they ought to be more so, proceeds to say: Fried dishes several timos a day, with several fried articles at each of the threo meals, is one of their common dietetic abominatioas; driod beof, old cheese and pickles, are among the common relishes, while lard and saleratus make their richer daiuties infectious and canstic. We bave seon ou a farmer's table fried pork, fried eggs, fried potatoes and fried griddle cakes for breakfast; fried ham, fried hominy and fried parsnips for dinner, and fried sausages and fried doughnuts for supper—all the frying doae in lard.

No class is so troubled with canker, erysipelas, tumors, cancers and hnmors, as farmers; snd tho excessive uee of pork, lard, fiae flour, rich cakes and greasy pastry, is enongh to account for it. In dietetic habits onr farmers are sadly misled hy the agricultural journals, nearly all of which pander to their prejndices and flatter their morbid appetites by recommending and commending swine hreeding and pork eatiag, while they fill their Kitchen Colnmn with receipts for making "rich and pslatable" puddings, pies, cakes and other complicated dishes, which no stomach ever carried inside of a human body could long tolerate without death or dyspepsia. The essential need of our farmers is plain, wholesome food, properly cooked. This would give them mnch more available power for work, relieve them of many of the distresses and expenses of sickness, add many years to their life, and reader old sge "green" and normal instead of dry and docrepid, as it is in most cases under existing hahits.

Plants as Doctors.

In addition to the pleasure that may be derived from horticultnre, the sanitary valne of flowers and plants is a feature of the subject so important ss to call for special meation. It was known many years ago that ozone is one of the forms in which oxygea exists ia the air, snd that it possesses extraordinary powers as oxident, disinfectsnt, and deodorizer.

Now, one of the most important of late discoveries in chemistry is that made by Professor Manegazza, of Paris, to the effect thst ozone is generated in immenso qnantities by all plaats and flowers possessing green leaves and aromatic odors. Hyacinth, migaonette, heliotrope, lemon, mint, lavcnder, narcissus, cherry, laurel, and the like, all throw off ozone largely on exposure to the sun's rays; and so powerful is this great atmospheric purifier, that it is the belief of chemists that whole districts cau be redeemed from the deadly malaria which now infests them by simply coveriag them with aromatic vegetatiou. The bearing of this upon flower culture in our large cities is also important.

Experiments have proved that the air of cities contains less ozoue than that of the surrounding country, and the thickly inhahited parts of cites less than the more sparsely huilt, or than the parks snd open squsres. Plants and flowers aad green tress oan alone restoro the balance; so that every little flower-pot is not merely a thing of heauty while it lasts, hnt has a direct and heneficial influence upou the health of the neighborhood in which it is found. Surely it is a beautiful provision of Nature thst something which is at once the most daiaty of occupation and most delightful of amusements shonld he intimately bound up with the solntion of problems so important as the health of our cities aad the redemption of fever-infected districts in the country.—*Appleton's Journal.*

Prof. Tyndall arguee against the commonly taught notion that man requires absolutely pure air and water. Chemically pure air—air that is without a trace of ammonia, carhonic acid, or water—is, he ssys, not to be found, and the one thing certain about it is, that if it were, no one could live in it. Neither is pure water ever fonnd in nature; snd observation of the whole animsl creation, incinding man himself, tonds to show that pure water ie not necessary, nor even demonstrahly desirahle. Every sunbesm which enters a darkened room shows how thick with solid impuritiee is the air which man hreathes—yet no one on thst account fears to breathe it; the same thing holds true in regard to water, hut this need not necessarily make sny one afraid to drink it. Neither all foreign matters, nor even all foreign organic matters, are of necessity unwholesome, and the votaries of strict science too often represent msn ss a being who mnst submit the world to a series of severe chemical operations before it is fit for him to live in.

The State Geological Survey, 379.

UTAH MINE SWINDLES.—We have been thinking for some time of keeping the heading to this item in type constantly, as we have, unfortunately, to use it so often. The Utah people are certainly out of luck in having so many mining sharpers among them, as it does the interests of the country incalculable damage. In future the man who tries to float a Utah mine will have his hands full. We notice that capitalists at the east are making a general onslaught upon those who have robbed them with Utah mining property. John N. Whitney, a prominent mining operator, has been arrested and taken east on a requisition by the governor of Michigan, charged with fraud in the sale of the Eureka mine, Tintic. Three more requisitions are at hand for other parties. The trouble about all this is, that the swindlers never get punished.

COURSE OF LECTURES.—The trustees of the Mechanic's Institute, in conjunction with the State University, have provided for a course of fourteen lectures, to be given by the Professors in the University, during the winter, as heretofore, on Saturday evenings. The price of tickets for the course has been fixed at $2, which is expected to cover expenses. The course will commence Saturday, January 3d. and he as follows: January 3d, President Gilman, on *Modes of Promoting Scientific and Industrial Education in Large Towns*. January 10th, President Gilman, *On the Use and Conduct of Modern Universities in Free and Prosperous States*. Lectures will also be delivered by Professors James Le Conte, Carr, Soule, John Le Conte, Kellogg and Swinton.

Hydraulic Engineering on the Pacific Slope.

Virginia and Gold Hill Water Works—Iron Pipe under a Vertical Pressure of 1,720 feet—A Great Undertaking Working Successfully.

Ever since the silver mines were first opened on the Comstock lode, it has been a question of importance how to supply the towns that spring up in the vicinity, and more especially the mills and hoisting works, with water. A company was organized at an early day, which proposed to use the water from several old tunnels above the level of Virginia City, for the purpose of supplying this want. After a few years they found that the supply would not be sufficient, but by drifting additional tunnels at different locations, they increased the volume of water, which has been plenty up to within the past two years. As the shafts on the Comstock lode were sunk deeper and lower levels run, the supply from the tunnels, etc., diminished sensibly. The water necessary for the growing towns of Virginia and Gold Hill, as well as the new and enlarged hoisting works, required that additional steps should be taken to supply this deficiency. A company which is composed of such enterprising men as Flood and O'Brien, John Skae, Mr. Hobart, Alvinza Hayward, James Fair and John Mackay, directed their attention to the eastern slope of the main Sierra Nevada mountains and especially to the so-called Dall's creek, which is within a distance of 21 miles on the line of the water course to Virginia. They also purchased the necessary lands and a lake called Marlette lake, situated at an elevation of about 1,500 feet above C street, Virginia, and within a mile of the eastern shore of Lake Tahoe, but about 1,000 feet above its level. This lake has an area of about 300 acres and is 15 feet deep when full in the winter.

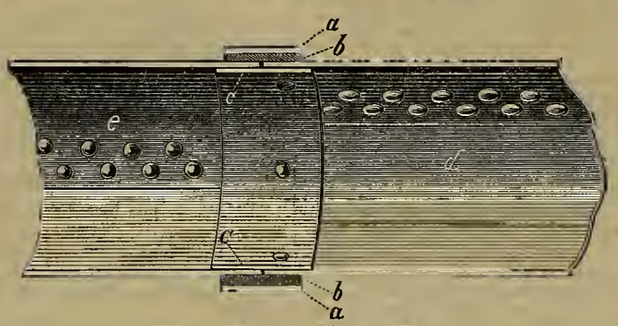

FIG. 1. LEAD JOINT IN DETAIL.

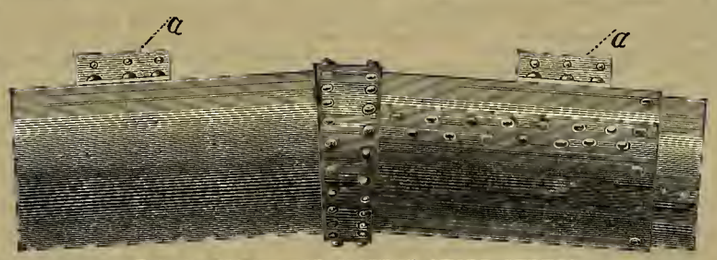

FIG. 2. ELBOW FOR MAKING SHORT CURVES.

The Great Difficulty

In bringing the water from these places over the proposed route, was the necessity of crossing a valley seven miles in width, with steep and precipitous sides, where the pipe in the shape of an inverted siphon would have to sustain a pressure of over 1,700 feet perpendicular.

The Work Inaugurated.

In the fall of 1871, the company referred to engaged Mr. Hermann Schussler, of the Spring Valley and other water works, to examine into the feasibility of their project. He reported favorably, and gave the company the assurance of the entire practicability of the scheme. In the spring of 1872 operations were begun, and Mr. Schussler made the necessary surveys personally, and furnished the proper requisitions for rivets and iron, which, by the way, consisted of ten different numbers of the Birmingham gauge, graduated from No. 16 to No. 0. The project was then well under way. The firm of McCrindle & Co., of this city, furnished the Scotch iron, and Geo. C. Johnson & Co., of this city, the rivets, which were of American manufacture. The contract was awarded to the Risdon Iron and Locomotive Works, for making the pipe according to the specifications and under the personal supervision of Mr. Schussler. The Risdon Works, especially owing to the great care of their superintendent, Mr. Joseph Moore, acquitted themselves of their difficult task to their great credit. The Risdon Works make a specialty of this class of work and in many of the various hydraulic enterprises with which they have been connected have made the necessary calculations, and always guarantee their work to do what they promise. They have made a large proportion of the iron pipe now in use in the hydraulic mines in this State, more especially where high heads are used. They have special tools for turning out this work, and Mr. Moore's great experience in this line has enabled him to make accurate calculations as to size of pipe, iron, nozzles, questions of fall, head, etc., so that the Risdon Works make nearly all the pipe used in our mines, always having orders of this kind on hand.

Although during the first month that the water was turned in and through the pipe, a great deal of difficulty was experienced with the

Lead Joints in the Pipes,

On account of expansion and contraction, yet by the application of proper apparatus, shown in the accompanying illustrations, the pipe was made perfectly tight and safe, so that at the present day, after three months' use, the pipe has proved wonderfully successful. It is worthy of remark, as showing the kind of pipe turned out by the Risdon Works, that there was absolutely no leakage in the pipe joints, it only occurring at the lead joints where the pipes are joined together.

Figure 1 shows one of these lead joints, which is made between every two lengths of pipe of 26 feet 2 inches in length each; *a*, is a wrought iron collar, always one-sixteenth of an inch thicker than the thickness of iron in the respective pipe, leaving a play of ⅛ of an inch between the inside of the collar and the outside of the pipe. The collar is five inches wide; *b*, is the lead which is run in and then caulked up tight from both sides, the thickness being ¾ of an inch; *c*, is a nipple of No. 9 iron, 6 inches in width, riveted in one end of each pipe by means of six ⅝ rivets.

Figure 6 shows the method of

Tightening Leaky Joints;

a, shows the clasp and its application for forcing back the lead, where it had worked out on account of the longitudinal working of the pipes by expansion and contraction. This is shown both in perspective and in cross section. The clamp, *b*, in Fig. 6, is used to keep the lead in place after it has been forced back by the clamp, *a*. The two lower sketches of this clamp, *b*, show both a side view and elevation.

The Pipe,

The most difficult feature of the undertaking, begins at an elevation of 1885 feet above the track of the Virginia and Truckee railroad, at a point about two miles west of Lake View Toll House, and thence follows by an easterly course the crest of the spur from which it starts; crosses the valley at the toll house referred to, and gradually ascends to its outlet end, making the entire length 37,100 feet. The water at present is taken from Dall's creek by an 18 inch flume four miles long, to the inlet, or western end of the pipe. From the outlet or eastern end of the pipe, the water is conveyed through a flume of the same size, 9 miles long, into Virginia and Gold Hill, where it connects with the present city pipe system. In the future the water from Marlette lake will be conveyed to the inlet of the pipe and be added to the supply from Dall's creek.

All the iron pipe used is coated, inside and out, with a mixture of asphaltum and coal tar, thoroughly boiled together, each separate piece being plunged and rolled about in a bath of this mixture for from seven to ten minutes before being shipped to its destination. The average diameter of the pipe is 11⅛ inches, and its entire weight about 700 tons. Nearly one million rivets were used to manufacture it and some 35 tons of lead were required in making the joints. At the point of heaviest pressure the iron is No. 0 thick, and is hot riveted with ⅝ inch rivets, there being a double row on the straight seam and a single row on the round seam. The pressure gradually decreases as the ground rises to the east and west, and the iron decreases in thickness from five-sixteenths to one-sixteenth of an inch toward both inlet and outlet. But on its course to the outlet, it having to cross a great many spurs and sags, the iron varies of course according to the pressure, as the diagram (Fig. 7) shows.

Pressure on the Pipe.

The inlet has a perpendicular elevation above the outlet of 465 feet, but just now only 300 feet is used, as this head will supply ten times as much as the two towns have heretofore had. This head carries into Virginia about 2,000,000 gallons every 24 hours, and by increasing the head to its fullest capacity, the supply can be increased to 2,350,000 gallons per day. When the water is running with its present supply, as used at Virginia city, it has a pressure of 1,720 *feet perpendicular* or 750 *pounds to the square inch*. But while the extra tests were being applied the pressure was brought as high as 800 pounds to the square inch without injuring the pipe in the least. The pipe and a joint were tested at the Risdon Works before shipment and stood a pressure of 1,400 pounds to the square inch.

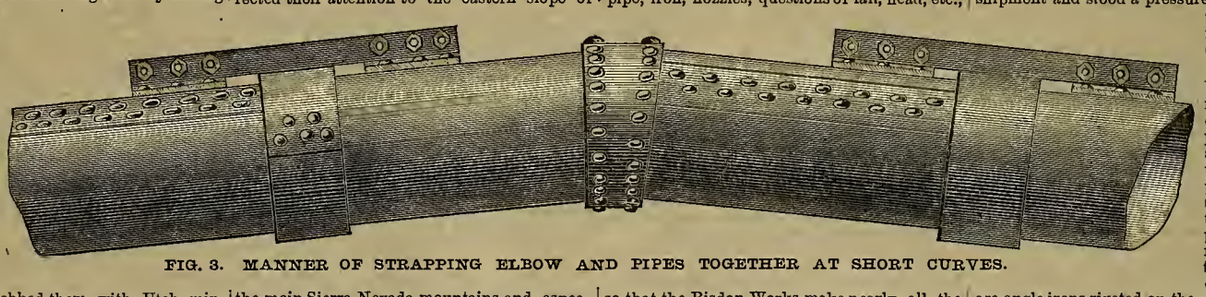

FIG. 3. MANNER OF STRAPPING ELBOW AND PIPES TOGETHER AT SHORT CURVES.

Crossing the Gorges and Spurs

Was a difficult matter to carry out with the pipes. Fig. 2 shows the elbow used for the purpose of making short curves in the line of the pipe around rocky bluffs, through sharp ceñons, etc; *a*, *a*, are angle irons riveted on the pipe on the outside of the curves, which, by means of iron straps, were connected with the corresponding angle iron on the next pipe.

Fig. 3 shows the manner in which the pipes and elbows were strapped together, wherever the curve was sufficiently short to require this precaution against an outward movement. The iron strap is put on the outside of the curve to strengthen the pipe.

Fig. 4 shows the blow-off used in every low place, and marked with a triangle in Fig. 7.

Fig. 5 shows the self-acting

Air, or Vacuum Valve

used at each high point on the line of pipe. When the water is on, the valve, *a*, is kept wide open; the small valve, *c*, is shut, while the valve, *b*, is shut by the pressure. If any air accumulates in the pipe, on the elevation where this air cock is placed, it is occasionally blown off, by opening the cock, *c*. Should a break occur in the main pipe line at a point lower than the air cock, and within its district, the valve, *b*, falls down and admits the air into the main pipe so as to prevent a vacuum. Should the valve, *b*, get out of order, the valve, *a*, is shut, and the other valve, *b*, taken off and repaired. After a break on the main line is repaired, and the water let on again, the valve, *b*, being

down or open, the air rushes out at *b*, its stem being weighted by the weight, *d*, so as only to close when the solid water commences to rush out.

Engineering Difficulties.

Fig. 7 will give our readers an idea of the country over which this undertaking was carried out, as it shows a profile of the pipe. The triangles below the lines indicate the location of the blow-offs. *O*, above the line, represents the cocks. The numbers shown along the undulating line show the numbers of iron used under the various pressures. The perpendicular columns of figures from 100 to 1,700 indicate the pressure on the pipe at the points where the parallel lines strike the profile.

Quick Work.

From the time of commencing the manufacture of the pipe until the water ran into Virginia City, only five months elapsed, the water arriving there about the first of August. To construct a work of such magnitude in so short a space of time, and with such success, reflects great credit on the engineer, the foundry and all concerned. The diagrams used in connection with this article were kindly furnished us by Mr. Schussler, and we produce them here to give the mechanical world an idea of the details of construction of the line. As an undertaking in hydraulic engineering it was difficult, as the body of water had to be passed through a huge inverted siphon over seven miles long, in doing which such an enormous pressure as 1,720 feet had to be overcome.

Greatest Pressure in the World.

Up to the completion of these water-works, the Cherokee Flat pipe, which is under 930 feet pressure, was sustaining the greatest pressure of any in the world. Mr. Schussler was also consulting engineer in that enterprise, and figured the exact thickness of iron and quantity required at different pressures, number of rivets, etc. The pipe which we have been describing sustains nearly double the pressure of the Cherokee Flat, and stands now the greatest in the world, the ordinary pressure being 1,720 feet. It was an engineering feat of no small magnitude to carry this enterprise to a successful completion; and in view of the difficulties to be overcome, it will attract the attention of engineers all over the world.

Mr. Hermann Schussler,

The constructing engineer of this work, though quite a young man, has been engaged in nearly all the prominent hydraulic engineering enterprises carried out on this coast for some years. He is a graduate of the Prussian Military Academy of Oldenburg, of which he was a member from 1859 to 1862, being promoted lieutenant on the first of January, 1862. In the fall of that year he took leave of absence for two years, and during that time attended the civil engineering schools of Znrich and Carlsruhe, for the purpose of perfecting himself in his intended profession of civil engineer, as he desired giving up a military life. In the fall of 1864, having had his leave of absence changed into a definite leave from military service, he came directly to San Francisco, where he entered into the service of the Spring Valley water works, first as assistant engineer, but was promoted afterwards to chief engineer of the undertaking, which was finally completed to the satisfaction of every one in 1871. From this time his career in other large works on the Pacific coast commenced. He was connected, as consulting engineer, with the Oakland water works, San José water works, Vallejo water works and Stockton water works; was chief engineer of the Marin county water works and those of Virginia City and Gold Hill. During the past year he was chief engineer of the Sutro tunnel company, where, as our readers will remember, he made the very close connection between the header and shaft No. 1, on the 27th of September last.

Outside of all these duties, Mr. Schussler has been employed partly as consulting engineer and partly as projector in various hydraulic enterprises in different parts of the State, which have always been carried out successfully. He surveyed the ditch of the La Grange Hydraulic Mining Company, in Stanislaus county, and was consulting engineer, as before mentioned, of the Cherokee Flat mining pipe. He projected the present Pioche water works, in Nevada, where he makes a five inch pipe of No. 16 iron, 6 miles in length, sustain a vertical pressure of 600 feet. The private water works of General Miller, in Napa valley, were built under his supervision, as were the fire protection works at the New Almaden mine. We might mention numerous other undertakings with which he has been connected, if space permitted, but have instanced enough to give our readers an idea of his ability in hydraulic engineering.

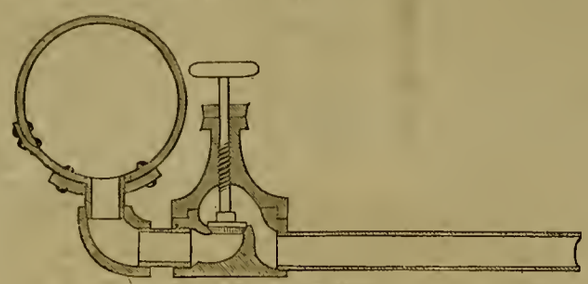

FIG. 4. BLOW-OFF IN EVERY LOW PLACE.

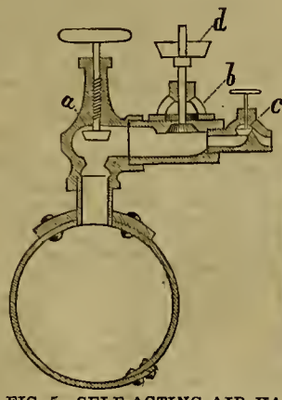

FIG. 5. SELF-ACTING AIR VALVE.

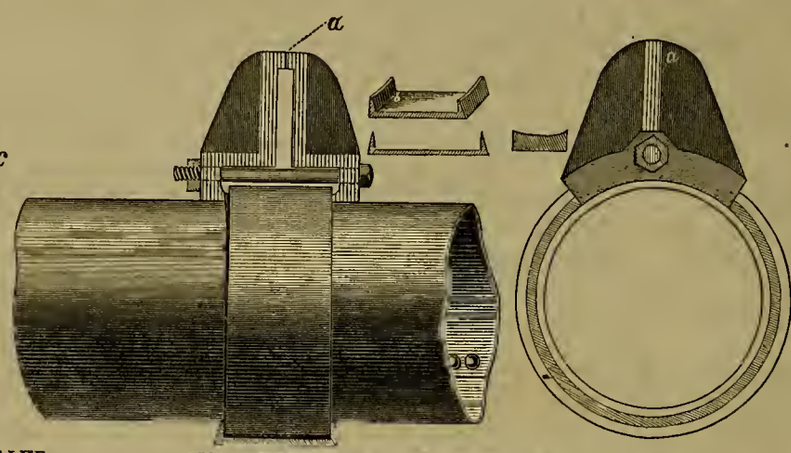

FIG. 6. METHOD OF TIGHTENING LEAKY JOINTS.

Ball's Sweeping Dredger.

Operations were commenced this week to deepen the water on the Oakland bar, across the mouth of Alameda creek. The dredge being used is of a new and peculiar description, the invention of John A. Ball, of Oakland. The buckets run on an endless chain, but operate very differently from those on the ordinary endless chain dredge. The buckets are made to pass down on top of the chain and up underneath, contrary to the usual method. They are made of wrought iron, the nose only being of steel. They cut forty inches across and each one will carry a cubic yard of mud. Each bucket with attachments will weigh about 750 pounds, and the machine carries twelve in all, though only four are rigged at present.

The buckets are made rectangular in form, and ride on two chains on either side, which has one end pivoted to each side of each bucket by a rod which passes across inside of the bucket; the opposite end of the link being connected with a curved advance rod. By this means the upper portion of the bucket, as it reaches the top and in turning the pulley, is made to swing out from the curve of the chain and rise in a perpendicular position. While in this position it discharges its load automatically, the curved rod acting as an arm to hold the bucket in its perpendicular position.

The bottom of the bucket is hinged to the side farthest from the chain and a roller or small cylinder is supported at each end by the two chains just below the free end of the bottom when it is closed. It will be readily understood that when the bottom is closed and the bucket stands in a line with the length of the chains the roller will support and keep the bottom closed, but when the bucket moves around the upper drum the lower end will be forced outward and upward by the short turn which the bucket must make, and thus free the bottom from the roller so that it will fall open and allow the load to drop out. As soon as the bucket turns the upper drum and starts down the chain again, the bottom closes automatically and the roller again moves up against it and keeps it closed. The device for operating the valve and holding the bucket in proper position until it is discharged is very simple and effective.

The chain which carries the buckets is a peculiar one, being an improvement perfected by Seth Wetherbee, of this city, who has the contract for dredging the bar. Each alternate link is cast iron, and the chain weighs a little over 30 pounds to the foot. The chain on each side is 114¼ feet long. Each cast link is three inches wide and the wrought ones are 2⅛ inches wide by one inch. The cast link is made with a steel bushing, and a steel pin turns in this bushing, but is otherwise kept in a stationary position. A powerful set screw is arranged to take up any slack in the chains and keep an even tension on both of them.

The barge which carries the machinery is a heavy one, 70 feet long, by 20 in width. The machine was originally made for the Central Pacific Railroad Company, and cost some $14,000. The expense of putting in Mr. Ball's improvement will amount to from $4,000 to $5,000. The engine is of 40 horse power, with a 12 inch cylinder and 28 inch stroke. The engine is connected with the driving shaft of the machine by a system of gearing so as to increase the power.

The "ladder," at the top and bottom of which are the pulleys which carry the chain on which the buckets ride, is 50 feet long, the pulleys increasing it to 56 feet. This allows them to dig 30 feet deep if necessary. This ladder is hoisted and lowered by the engine, so as to vary with the depth of the water. The chain will make a revolution every ten minutes.

Mr. Ball calls his invention the "sweeping dredge," from the peculiar manner in which he proposes to operate it. At the bow or opposite end from the dredging machinery is placed a large triangle made of heavy timbers, which is some 70 feet long. At the pointed end of the triangle is a heavy stake pointed at the bottom and pivoted to the triangle at the top. This whole arrangement is raised by machinery. On beginning operations the triangle is dropped and the pointed "spud" sticks in the mud firmly. An anchor is put out on both sides at the extreme edge of the channel and the dredge is hauled from one side to the other by guys on the dredge. As the spud on the triangle keeps the machine from going ahead or backward, it is "swept" from side to side by the guys to the anchors passing over pulleys attached to the machinery. By this means the machine can take off four feet ahead each time, and can by lengthening or shortening the triangle take in a sweep of 30 feet long and as wide as the length of the triangle will admit. The apparatus requires an engineer, a fireman and a man to "feed" the machine. All the iron work on the buckets, chains, etc., was done at Scoville's machine shop in Oakland, and a very good job he has made of it. At the preliminary trials, made this week, the machine worked well, and active work commences as we go to press. At present the triangle proposed by Mr. Ball is not in use, the barge having a plain "spud" attached in the bow. The contractor has four months to complete the contract.

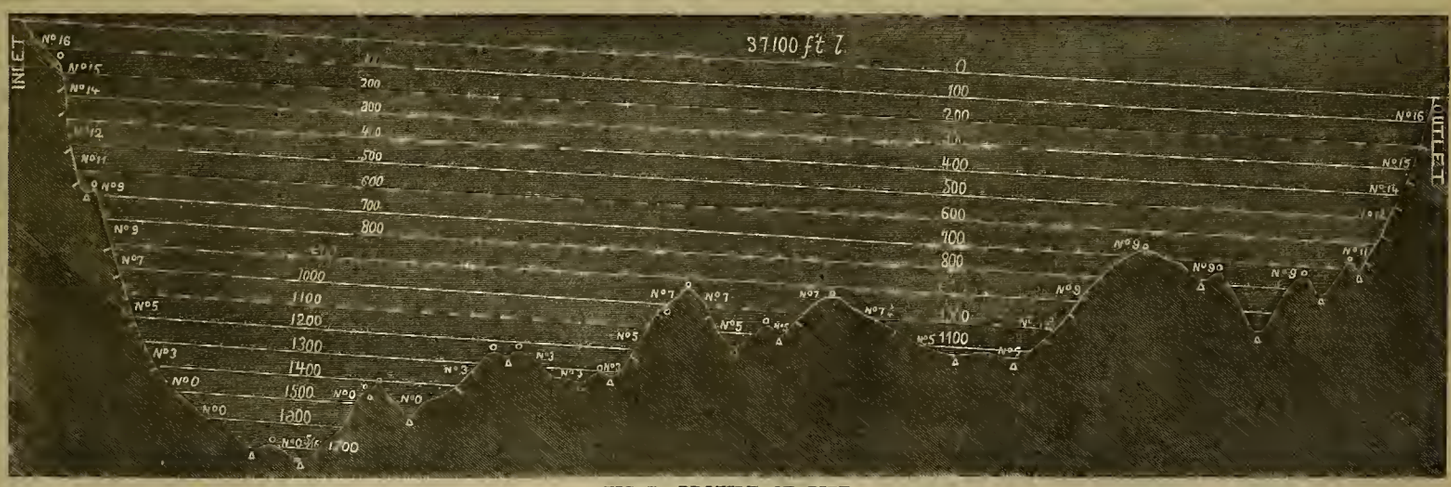

FIG. 7. PROFILE OF PIPE.

MINING ACCIDENTS.—John Mulcahy was instantly killed and his body terribly mangled by falling seven hundred feet down the main shaft of the Hale & Norcross mine, at 8.30 on the 8th inst. Seemingly in a fit of absent-mindness he ran a car into the open shaft. The sudden jerk of the car pulled him after it. He fell from the surface to the 700-foot level. His head was taken off from his chin upward; he was cut in two at the hips and both legs cut off near the knees.

Daniel O'Donnel was killed in the Eureka mine, Sutter creek, on the 10th by a rock falling and striking him on the head.

The Loyola Scientific Academy.

The Loyola Scisntific Academy is the nsms of a society which was permansntly establishsd by Fsther Jossph M. Neri, of St. Ignatius College, in this city, in Msy of this year.

This junior academy is intendsd for yonng gentlemen who wish to cultivate ths natural sciences, principally in the branchss of general physics, chsmistry, mineralogy and geology. Any gentleman of good standing, who has devotsd some time to the study of thess branchss of scisncs is eligibls to msmbership, upon a written application, sndorssd by some of the active memhsrs of this Academy. If admitted, they attend first as junior memhers; and after having given sufficient evidence of their interest, proficiency aud capacity, they may be promoted to the position of senior members and receive then a certificate of membership.

The academy numbers already many talented young men; is in a very prosperous condition in its very iufancy, and from all appearances promises to he very nseful and important.

The meetings take place regularly, twice a month. At the scientifio meetings, which fall on the first Monday of every month, visitors are always welcome; and several of them have improved the opportunity and made good nse of the privilege.

The regular exercises consist—First, of an original essay, upon a suhject previously assigned. Second, a scientific conference, or diecnssion upon a stated suhject, carefully prepared, in which four or six members take part, each on a certain portion of the subject allotted to him. Third, a paper of scientific intelligence, or a notice of recent facts and discoveries, improvements, inventious, etc. Fourth, solution of queries and problems, previously proposed, and assigned for solution to the various members of the academy. Fifth, volnnteer scientific notices, and discussion on the same, by any of the members, active or honorary. Then new subjects, queries and problems are proposed, adopted and assigned for the next Monday; and thus two or three hours are very usefully, interestingly and pleasantly spent by all.

At one of the late meetings a very interesting essay wss giveu hy Mr. J. F. Sullivan, A. M., on the importance and advantages of the study of natural science.

A conference on diamonds; their composition, properties, localities, and means of detecting them, by Messrs. T. D. Riordan, A. B., Jerome Hughes, Thos. H. Griffin, A. B., etc.

Another couference, or discussion, on atmospheric air; its physical and chemical properties; its composition; the functions of its components, their transformations, consumption and eupply, by Jno. T. Fogarty, Alf. Kelley, James Boland, and J. Hughes. A paper of scientific intelligence on the discoveries of 1873, by Rohert Tohin, A. M.

The following queries and problems were aolved by other memhers:—Why has California a dry and a wet season? Why is lightning forkèd? Why do cloudsflost in thoair? Do we see the sun and stars in the exact place they occupy? Iufluence of aqueous vapor on climate; causes and influence of the Gulf stream; why is the conntry more healthy than the town? etc.

The next scientific meeting will he held on the first Monday of next month, Janusry 5th, 1874, when the essay will he on the beauty aud importance of the study of physics, proper. The conference will be on coal; its formation, localities, means of extraction, abundance, uses and products, and its influence on progress.

Among other questions, the following will be answered:—Ou flame and combustion; the action of nitric acid upon iron; the soluhility of substances; why does the south wind bring rain to San Francisco? On certain sounds rising in pitch as they approach our ears, etc. Important scientific notices will be given, and visitors are welcome to propose new problems and queries for solution.

A library has been already commencsd, which, it is hoped, hy the help of patrons and promoters of science, will soon contain the most valuable scientifio books of the time, and will be the means of spreading useful knowledge, besides aiding the memhers to prepare their regular exercises.

Affairs in Ely District. — The Pioche *Record* of the 30th nlt. says: A perusal of our separate review of the different mines referred to in our present issue cannot fail to give hope to the despondent and inspire with renewed oourage the more hopeful of the community. Only one prospecting party has left Pioche eince our former review, and we hear of none which contemplates an early departure. Matters are apparently fast adjusting themssl ves by the departure to other localities of the discontented portiou of the population, leaving those who remsin more opportunities for obtaining work. We have no items from any of the districts adjaoent to our own, and heuce this week's review will not he lengthy. Coneidering that we are upon the eve of "pay day," times are not so dull. With the dishursement of a large amount of money to the nnmerous employés of the different mining companies, we look for a better state of affairs before the end of the week.

The Harbor of San Francisco.

Governor Booth spssks as follows in his message concerning ths harbor of San Francisco:

In November, 1863, the Stats took posession of ths water-front at Ssn Francisco, and has since that dats managsd it through her Board of State Harbor Commissioners. The Board has collectsd $2,196,094.64, and has expsnded $1,929,388.23. The only improvement of a permanent character that has been made, is a sea-wall embankment 3,252 feet in length. The Act authorizing the construction of this bulkhead requires it to he 8,337 fsst long, but the work was suspsnded three years ago becauss ths rsvsnuss from port charges were insufficient to prosecute the work and to pay current expenses.

In national importance, the port now ranks third in the respect of duties paid on imports, and in other respscts ranks equal with any; and as a subject of vital interest to the State, it is entitled to and demands the most serious, deliherate and lahorious attention.

The wharves are constructed of such material aud in such a manner that from the moment of their completion there is the certainty that they must he rebuilt, partially within three years, and (excepting a few) wholly within a few years more. The harbor is constantly and persistently shoaling. The sewerage system of the city increases the evil. The water front presents to tidal currents a series of obstructions which produce eddies, and a euccession of angular traps for mnd and sediment. With an increasing commerce, there is no adequate increase of accommodation, hut on the contrary there is danger of a deorease. The State has expended $115.33 per day since Novemher 1, 1863, for dredging in slips and at docks, levying a tax upon commerce to pay the aggregate of $401,361.10 and the work has simply given temporary accommodation to vessels. It has not been of the least permanent benefit.

The ravages of the *toredo navalis* and the *limnoria terebrans*, destructive marine worms, preying constantly upon wooden piles; the various methods of protectiug and preserving suhmerged wood; the shoaling at the docks; the dredging, repairing, rehuilding and creating new facilities for commerce; and especially the radical change in the outline of the water-front necessary to a system of wharvos and docks constructed npon engineering principles are ably and elahorately discussed in the report of the State Harhor Commissioners. It is apparent that if the State continues to mauage the water-front, it would be difficult to devise a plan for the purpose more effective and economical than the present one, honestly administered as it now is; and if the only deductions that can be drawn from ten years' experience with it may be accepted as correct, the fact has been demonstrated that in order to create a water-front worthy of the important position, and to remove the world-wide stigma of exorhitant port charges in our harhor, the State must resign direct control and management. This is the nnavoidable conclusion of the theory of making commerce pay for the harbor improvements. The revenues will suffice to pay current expenses, and to make ordinary repairs, but no genuine advantsge will be gained or substantial improvement made, nor will the surplusage of receipts enable the best management to meet the requirements of an annually increasing tonnage.

But one alternative presents itself, and that is the increase, hy taxation of property, of the revenues devoted to the construction and maintenance of wharves, docks and piers.

Without discussing the question or cousidering here whether snch a tax were most appropriately laid on the property throughout the State, or on that in San Francisco alone, I recommend the latter, and in my opinion the city of San Francisco should be vested with entire charge of the water front, under carefully devised and well considered restrictions, and under a statutory scheme that will eventually result in a free port, and in establishing shipping facilities in our harhor that shall be second to none in the world. Ship aud car should be giveu all possihle facilities for coming together; and as the waters are open to all ships, so should the railrosd tracks along the piers he open to all the cars, of all companies, forever.

Substantial Water Works. — The *News* says: The Crown Point, Yellow Jacket aud Keutuck mining companies, together with the Virginia and Truckee railroad company, own in partnership a large tank situated just above tho American Flat grade. A six-inch cast-iron pipe wae the first employed to convey water from the tank to the hoisting works and to the railroad depot. The pressure upon the pipe, however, was so great that it hursted at several points. The several companies named above procured an eight-inch wrought iron pips, which has heen laid, and answers well all the purposes for which it was intended.

The Plumas *National* states that during the past three or four weeks Mr. A. C. Light has taken from his little ledge, located on the mountain south of Indian Valley, Plumas Co., Cal., something over $5,000. The hest part of it is that he hae pounded it out with a hand mortar, aud has plenty more of the same rock left. Mr. Light has recently purchased a little ranch of Mr. Frank Fox, which was in the cañon below his mine, and he will make arrangements to sluice off the ground under the ledge during the coming water season.

Academy of Sciences.

Our usual rsport of the meeting of the California Acadsmy of Sciences wss orowdsd out lsst week. The mssting was held on the 1st inst. and Msssrs. J. R. Scripharn, Henry Kimhall, Dr. E. J. Fraser, S. P. Carusi and W. W. Lockington wsre electsd msmhsrs.

The following donations to the Cabinet were received: From Hsnry Edwards, a fishing drsss wovsn of soms kind of cordage fahrio growu on Fiji Islands and nsed hy the females, probahly to protsct thsmselvss from injury hy ths coral rocks. From Captain George E. Bslknap, of the United States steamship *Tuscarora*, a lump of Nanaimo coal, from the Chase River seam, with fossils and fossil leaves distinotly marked in it. From Captain William E. Metzger, two shell fish of the genus *Pinna*, ahout a foot aud a half in length, taken from the hay of Espiritu Santo, near La Paz, Lower California. From Castle Bros., two suits of Japanese armor, suitahle for a Daimio and attendant. From Professor Agassiz, a splendid edition of the "Revision of the Echini," beautifully illustrated. From the New Zealand Institute, a copy of the "Transactions of the New Zealand Institute." From Mrs. J. C. North, a collection of plants from Norway. Erom Mrs. Swift, of San Francisoo, two volumes of the United States Astronomical Expedition to Chile. Three photographs of the moon snd various miscellaneous pamphlets and magazines were also donated.

Professor Bolander described by the aid of the blackboard the different lilies of California.

Professor Davidson made a few remarks with regard to the advantages of a circular diamond saw for sawing stone.

Gold on the Yellowstone.—A correspondent of the *Montanian*, writing from Bozeman, Montana, ssys: The Yellowstone gold excitement ie inteusifying here. Every day or two a party quietly slips out of town to find and follow the trail of Professor Vernon, the reported discoverer. But the excitement has the peculiarity of being of a semi-suppressed character; nohody cares to acknowledge confidence in the Professor's story, yet it is evident that confidence therein is daily growing strongsr. I will briefly give the particulars. for the benefit of your mining readers. The Professor started from Bismark last spring, with Geu. Stanley's command, aud accompanied it as far up as it came, when he left the expedition and came on through here to Bozeman, his old home. Arrived here, he told astonishing stories ahout the richness of hill, gulch and bar diggings he had found "ahont 300 miles down the Yellowstone valley;" said he "could pan out more money in a week than he could make teaching school an entire year;" that "the gold was coarse and the gronnd prospected from the surface down," and that "the working facilities could not be beat." His friends tried in vain to influence him to defer his trip until spring; he said, in reply to their remonstrances, that there was liahle to he a rnsh to the new diggings from the railroad, as two men returned there who were with him when the discovery was made, and he didn't want others to get in ahead of him. The Professor is of rather excitable nature, and, some say, more than ordinarily imaginative; hut would any aane man start ont on such a trip, at this season of the year, on anything short of "a sure thing?" This is the consideration which has inspirsd such general confidence among our citizens. And then the Professor was plainly informed that his followers might become *desperate* if he disappointed them.

Rich Disooveries.—The *Bedrock Democrat* (Baker City, Oregon) says: The new quartz ledge, the discovery of which we mentioned last week, created considerable excitement in our city, and started several other parties on the look for other ledges in the vicinity of the new discovery, and there have at least three others been discovered; two by Rockefellow, and one hy Fred Bohna. The James Gordon ledge, to the extent of 1,560 feet, including the discovery, is owned hy W. H. Rockefellow, E. W. Reynolds, John Brattain and J. A. Reid, who have hsd an assay of the rock, which showed a richness of over $200 to the ton. The proprietors intend to have some twenty tons of their rock, which they are already taking out, crushed and worked at the Virtue mill to test its richness by the milling process. They have great faith in the richness of their new ledge, and we hope they may not be disappointed in their expectations. The other ledges, at the time of this writing, have not been tested hy an assay of the rock—the rock is good looking, and we would not be surprised if it was found to be equally as rich as that of the James Gordon. If these ledges prove good, it will give a new start to Baker City such as it has never yet experienced, Baker and Grant counties ahound in rich mineral deposits, and with capital to work and develop our mines, are hound to become two of the richest counties in the State; they have all the elements to make them so.

Ore Shipment.—We learn from Mr. F. A. Smiley, the ohliging telegraph operator at Gold Hill, that during the month of Novemher 2,279 car loads of ore passed over the Virginia & Truckee railroad to the various mills in Silver City, on Carson river and in Six-Mile cañon.—*Gold Hill News.*

Sitka Gold Mines.

The *Alta* is indebted to Mr. Theodore Haltsrn, a passenger by the lsst stsamer from Portland, for the following particulars of the rsosnt gold discovsries in Sitka. and for a sight of the rock which has tnrnsd the heads of our Alsskan nsighbors. The larger piece is of white quartz, with occasional masses of snlphurets of iron, snd very fine streaks of free gold, but clearly visibls to the naked eye.

The Main Ledge,

That owned by ths Alaska Quartz Mining Compsny, wss discoversd last winter by Mr. Haley, a miuer from Nevada, who had worked in ths Chollar-Potosi and Ophir. Mr. Haley went prospecting with some friends in Sitka, and discovsred this ledge at the foot of a ravine. The first specimens were pounded in a hand-mortar, and yielded sstisfactory results, and then work was prosecuted qnietly. Major Stewart, commander of the post, Mr. Millitech, and several other residents of Sitka, formed a company to furnish the means, and a tunnel was rnn in fifteen feet, the rock still giving encouraging returns. Specimens sent to San Francisco for assay, were found to yield $276 to the ton. Two tons were now sent for a working test, aud the reenlt is looked for every day.

The Extent of the Discovery.

Having satisfied themselves as to the richness of the rock, the discovers now inspected their property carefully, to find how mnch of snch ore they could expect to get. The ledge was found to be six feet in width, and widening as the tnnnel progressed; the ledge is distinctly traceable to the top of the mountain, 800 feet high, and inclining back so far as to give a penetration of 300 feet hy tunnel to strike directly under the highest point of the ledge. They estimate that at least 10,000 tons of the ore can thus be said to be in sight. Having settled the points of richness and quality, the oompany will now endeavor to get the necessary capital to work the mine and become millionaires. They have rich ore, plenty of timber, lots of water, good climate, and accessibility—all they want is the ready money to put up machinery.

Another Ledge.

The ledge first spoken of is three miles from Silver bay, which is twelve miles north of Sitka. Another ledge has since been discovered only two miles from this bay, and is said to be richer than the first. The width of the seam of rock is said to be eleven feet. Haley also discovered this ledge, and has formed a company with Mr. Rogers, Captain Olmstead and other officers of the post at Sitka.

How to Get There.

Silver bay is twelve miles from Sitka, and has deep water snfficient to float vessele of any size, and good anchorage. The mountains are heavily timhered with pine and cedar, and therefore vessels are nsed from Sitka to the bay, rather than to attempt to make a wagon road. Sitka is reached by steamers from Portland once a month, carrying the mails. The fare is $70; fare from San Francisco to Portland $30.

The people of Sitka are much elatèd over the discoveries, which they fell confident will bring a large population to Mr. Seward's purchase. And, hy the way, they brag of their climate, which is very mild, enabling minera to work both winter and summer.

Mining Accident.—An accident occurred in the Savage incline at 11 o'clock last night, by which one man had a leg broken and was literally skinned alive, and another was badly bruised. Sevon men of the shift retiring at 11 o'clock were ascending the incline from the 1,700 to the 1,600 foot level, on the monster giraffe "Comanche," and when near the latter level the huge engine flew the traok and did some ground and lofty tumbling. "Coon" Morgan, one of the miners on board, was thrown between the jumping giraffe and the side timhers of the incline, whereby his right leg was hroken just above the ankle, and the skin, and in places the mnscles of his back were torn off. Pat Burke, another of the passengers, was thrown npon the track in front of the giraffe, which passed over and bruised him badly, without fracturing any bones. The other five men were considerably shaken up and hadly scared, but fortunately the ascent of the giraffe was stopped hefore further damage than that mentioned was inflicted.—*Virginia Chronicle, December* 2d.

Miraculous Escape of Three Miners.—Yesterday morning, about 8 o'clock, the foreman of the Silver Hill mine and two of his workmen were precipitated to the bottom of the main engine shaft, a distance of 330 feet, and yet, wonderful to relate, escaped with their lives. They had no more than stepped upon the csge at the surface, for the purpose of descending into the mine, than the cahle hegan slipping on the reel, aud they went to the bottom with lightning-like rapidity. Luokily, there was a considerable depth of water in the dump at the bottom of the shaft, which broke the force of their fall.. Although a good deal cut and hruised, they managed to crawl into another compartment of the shaft, whsnce they were hoisted to the surface and properly cared for. Trnly the perile of the miner are many, and we may add, past finding out.—*Virginia Enterprise.*

The Crown Point Mining Company paid ont to their employés $76,000 on the 3d inst.

The State Geological Survey.

Governor Booth speaks as follows of the State Geological Survey in his message:

In establishing and continuing this work, the State has appropriated $246,600, and the State Geologist now reports $100,000 as the minimum appropriation adequate to the publication of the works in hand.

Admitting and regretting my own want of technical knowledge of the various subjects in connection with the geological survey, I think that the reasonable expectations of the people of the State, founded in great degree upon the reports and assurances of the State Geologist, have not been fulfilled by the results accomplished.

Early in February, 1872, for the purpose of obtaining definite information concerning work proposed, to be done, I addressed a letter to the State Geologist. The reply, dated February 12, 1872, stated that the volumes of ornithology, botany, conchology, and possibly palæontology, would probably be into the publisher's hands within a year. By his report, transmitted herewith, it will be seen that, notwithstanding the lapse of nearly two years, and the expenditure of $34,000, no new maps have been published which were not exhibited in proof sheets in 1872, and no new volumes have been published, nor have any been sent to the printer, except a portion of that on botany, "which will be in type, if no unexpected delay occurs, before the end of 1874."

The present condition of the survey is, that there have been published one volume of geology, two volumes of palæontology, one volume of ornithology, the Yosemite books, map of the vicinity of the bay of San Francisco, map of the Sierra Nevada adjacent to the Yosemite, map of the Yosemite Valley, and a portion of the map of Central California, and that there is a large quantity of work in various stages of preparation.

The operations during the past two years, as shown by the report, have been confined to trips to Yosemite, Alpine and Calaveras counties, the earthquake region in Inyo county, and a geological excursion from San Diego to Los Angeles.

Work was also done on that particular geology of the San Francisco Bay map, the immediate publication of which was promised eleven years ago. No other geological work was done; nothing in the mining district. It cannot be doubted that in authorizing the commencement of this scientific work, the Legislature contemplated that within a reasonable period of time, there would be published, and made accessible to all, one or more volumes of Economical Geology, embracing the mines and useful minerals of California, with abundant geological and mining maps and illustrations, and containing useful generalizations touching the several branches of what was then our leading and peculiar industry, together with important delineations of the gravel mines and ancient rivers. No such books or maps have been published, and, so far as the survey is concerned, the world is yet in ignorance of the geological features of the mining region on the western slope of the Sierra Nevada, excepting such information as can be gleaned from the generalizations and scientific descriptions contained in the one volume of geology published. A scientific description, and the accurate geological mapping of the auriferous area bounded by the Stanislaus river, Spanish Peak, in Plumas county, the Sacramento river, and the summit of the Sierra, would be of greater service to us than all that has been accomplished and made public, though, perhaps, less tributary to a wide renown.

The topographical maps are beautifully executed, exhibiting original and compiled work of great value; but no maps have been published showing elevation of areas, and there is nothing in the books, maps, or reports, unless incidentally, that will assist to solve the great problems of drainage, irrigation, or reclamation—problems so purely dependent upon the aid of science of the exact nature invoked by the State in this survey.

I am well aware that the published volumes are entitled to and have obtained the high appreciation and commendation of scientific institutions in the Old World and in the Eastern States, but I do not believe that it has been, or now is, the deliberate policy of the State to place her own best interests last in any scheme, however comprehensive, for the advancement of abstract science.

There are now in preparation, and it is contemplated to eventually publish, the following volumes, together with numerous maps: Physical Geography, General Geography, Economical Geology, Ornithology, Botany, Palæontology, Fossil Plants, Ichthyology, Conchology, and an Atlas Folio.

I recommend the appointment of a committee, whose duty it shall be to examine and ascertain the exact condition of all of these; to determine what shall be published, and when and how such publication shall be made; and to discover the amount necessary to be appropriated, in order to prevent loss to the State of work already done. And I am of the opinion that if the Geological Survey were connected with the University of California and made a part of its work, the best possible results could be secured, both from the materials on hand and those yet to be accumulated.

It is rumored that in the course of his expedition to Central Africa, Sir Samuel Baker discovered gold deposits of great richness.

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 338 Montgomery St., S. E. corner of California St., San Francisco.

The Mining & Scientific Press

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi. As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Every Miner, Assayer, Millman, and Metallurgist in the United States should take it.

Every Pacific Coast Mechanic, Engineer, Inventor, Manufacturer, Professional Man, and Progressive and Industrial Student should patronize its columns of fresh and valuable information.

Every Mining Engineer, Superintendent, Metallurgist, Mine Owner and Mine Worker in the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Every intelligent thinker in the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

DEWEY & CO.,

A NEW BOOK.

SECOND EDITION—REVISED AND ENLARGED.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 672 Pages and 83 Engravings.

BY J. S. PHILLIPS, M. E.,

Of San Francisco, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, $10.50; in leather, $12 (currency). Forwarded by mail for 50c. extra, by

DR. ABORN,
Physician and Operating Surgeon
FOR CHRONIC DISEASES,
213 GEARY STREET, . . . SAN FRANCISCO,

Diseases of a chronic and obstinate character, especially such cases as have for years, or a lifetime, resisted the ordinary modes of treatment, are the class of maladies in the treatment of which Dr. Aborn has become pre-eminent on the Pacific Coast, as well as throughout the Union, and by his success has acchieved for himself an enviable reputation. 23v25-1y

The object of this school is to impart a thorough education in business affairs. It is open to persons of both sexes and of all ages. There is an English Department for those not sufficiently advanced for the Business Course. Sessions continue day and evening throughout the year. Students can enter at any time. All wishing to be successful should secure a practical education at this College. Send for "Heald's College Journal," and learn full particulars. Sent free to all by addressing E. P. HEALD, Pres. Business College, San Francisco, Cal. 2v27-1y

HINTS FOR INVENTORS. We will send on receipt of stamp for postage, FREE, our 52-page Circulars containing 112 Illustrated Mechanical Movements; a digest of PATENT LAWS; information how to obtain patents, and about the rights and privileges of inventors and patentees: list of Goverment fees, practical hints, etc., etc. Address DEWEY & CO., Publishers and Patent Agents, San Francisco.

Giant Powder.

In our laet issne we published an extract from the Trnckee *Republican* on "Giant Powder in Fishing;" intending at the time to make some comments on the erroneous statements in the item. The writer says "it is so little understood, even hy scientific men, that no rules can he laid down for its use," which is entirely a mietake. It ie understood hy scientific men and rules are laid down for its nse. It is only when these rnles are violated that there ie danger of accident. If we violate the rules of common sense with common gunpowder, accidents will occur as well as with Giant Powder. The *Republican* states that "the nitro-glycerine oozes out of the earth with which it is mixed," when it is no safer than nitro-glycerine.

Theee statements would not have been made if the writer in the *Republican* had read an article on the manufacture and use of Giant Powder, which appeared in onr iesue of July 12th, 1873, after the exploeion at Virginia City. The Giant Powder ie transported everywhere on onr steamers, care and wagone, but the infueorial earth of which it is made holds the nitro-glycerine in such a manner that there is no danger of explosion. If ignorant people make foolieh experiments with it, they are apt to "come to grief," ae they would with any powder; and if people are careless and ignore totally the rules of common senee as well as the rules for using the powder, they have nohody to hlame hnt themselves. Unless exploded with the peculiar cap made for the purpoee, there is no danger from Giant Powder. When the explosion of nitro-glycerine occurred here at the company's works, there were 12,000 pounds of Giant Powder within 30 feet of the nitro-glycerine, and although the hoxes were torn to pieces, the powder did not explode. When the *Meteor*, on Lake Michigan, hurned up last year, there were 8,000 pounds of Giant Powder on hoard which *burned* up also, hut did not explode.

The powder is nsed to a great extent on this coast and elsewhere. Wherever any accident hae occurred, iuvestigation has proven that it was the result of stupidity, carelessness and from not following the directions issued by the company. So it is not "extremely dangerous in the hands of the most careful," ae the *Republican* seems to think. If that paper desired to deter parties from murdering fish hy using the powder, it took a good course to save them from it hy explainining its danger, and we appreciate its motive; hnt the statements need are exaggerated, and apt to convey a wrong impression of a very nseful article.

NEW MAP.—The State Geological Survey Map of California and Nevada, to which we referred at length in onr issne of Octoher 25th, has heen issued to the public. The scale ie 18 miles to an inch, and it is ahout 44x38 inches in size. The map is finely execnted, and in accuracy and appearance excele anything puhlished heretofore. The canvaesing agent, Mr. Sleator, is now calling at offices and places of hueiness generally, to receive the names of those wiehing to procure the map. It costs $3.50.

THE storm of the past week hae extended al over the coast and even San Diego got some of the rain. The San Diego river, which has been dry for eome five yeare, was running fnll at laet acconnts. Snow, hail, wind and rain have held high carnival for over a week and the ahundant enow supply in the mountains will eneure a good mining season, and good times for the miners.

A BED of marl has been struck in excavating for the stone dry dock at the Mare Island Navy Yard. It ie almost identical with the well known New Jersey marl, nearly and prohably ite equal ae an enricher of the soil.

MINERAL LAND.—Thirty-eight claims to mineral land have haen filed in the Stockto n Land Office during this year, covering 2,619 acres. Mineral lande sold, 2,159 acres, for $6,170.

CHISPA.—A Spaniard mining on Spring creek, Shasta connty, laet week found a nugget of gold weighing $300, near where Rochon took out a $3,000 chunk laet year.

THE caee involving the ownership of the Geysers and a numher of quicksilver mines adjacent thereto, has heen concluded and a deciion will soon he rendered:

THE NEW AGE.—Thie journal, the official organ of the I. O. of O. F. in this State for nine yeare, has recently reduced its eubscription price from $5 to $3 a year.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Nov. 4, 1873.

FOR WEEK ENDING OCT. 21ST, 1873.*

TENONING MACHINE.—William M. Sack, Oakland, Cal.

REISSUE.

WAGON SPRING.—Edmnnd P. McCarthy, aesignor to self and John B. Grant, S. F., Cal.

By Special Dispatch, Dated Washington, D. C., Dec. 9th, 1873.

FOR WEEK ENDING NOV. 25TH, 1873.*

STEAM PLOW. — Isaac S. Allen, Montelions, P. Browen and Charles W. Lathorp, S. F., Cal.

GRAIN SEPARATOR.—Samuel Daw, Corvallis, Oregon.

FLY-TRAP.—Cyrns Packard, Eureka, Nevada, and Syranus Standieh, Pacheco, Cal.

SPRING POWER. — Theodore Ebeling, S. F., Cal.

ROAD SCRAPER.—Roland F. Read, S. F., Cal.

MANUFACTURE OF COPPER INGOTS FOR ALLOYING GOLD AND SILVER.—John Feix, S. F., Cal.

PROCESS FOR PURIFYING QUICKSILVER. — James B. Randol and Charles W. Wright, New Almaden, Cal.

SHANK CASTER.—W. H. Hanna, Chico, Cal.

TRADE MARK.

CIGARS AND TOBACCO.—The Consolidated Tobacco Company, Gilroy, Cal.

——*The patents are not ready for delivery hy the Patent Office nntil some 14 days after the dato of issne.

NOTE.—Copies of U. S. and Foreign Patents furnished hy DEWEY & Co., in the ehortest time possihle (hy telegraph or otherwise) at the lowest rates. All patent husiness for Pacific coast inventors transacted with greater eecurity and in much less time than by any other agency.

KIND WORDS.

The Associated Reformed Presbyterlan says—For years Perry Davis' Pain-Killer has been known as a most useful family medicine. For pains and aches we know nothing so good as the Pain-Killer. For many internal diseases it is equally good. We speak from experience, and testify to what we know. No family ought to he without a bottle of Davis' Pain-Killor.

MESSRS. PERRY DAVIE & SON, Prov., R. I.—

Gents:—Although a stranger to you I am not to your invaluahle medicino, Pain-Killer. I formed its acquaintance in 1847, and I am on most intimate terms with it still; my experience in ite use confirms my hoief that there ie no medicine equal to Pain-Killer for the quick and sure cure of Summer Compisints, Sore Throat, Croup, Brulsee and Cuts. I have used it in all and found a speedy cure in every case.

Yours Truly, T. J. GARDINER, M. D

Judging hy our own experience whoever once makes a trial of Perry Davie' Pain-Killer, will not fail to recommend it widely as an unequalled liniment, and valuahle internal remedy for colds and various other complaints.—*Every Month.*

The efficacy of Perry Davis' world-renowned *Pain-Killer* in all diseases of the howels, even in that torrible scourge, the Asiatic cholera, has heen amply attested hy the most convincing authority. Missionariee in China and India have writted home in commendation of this remedy in terme that should carry conviction to the most skeptical, while its popnlarity in communities nearer home is ample proof that the virtues claimed for it are real and tangible. Among family medicines it stands unrivaled.—*Boston Courier.*

The *Saturday Even'g Gazette* of Boston, eays:

It ie impossible to find a place on thie hroad land where Perry Davis' PAIN-KILLER is not known as a most valuable remedy for physical pain. In the country, miles from physician or apothecary, the Pain-Killer ie cherished as the exclusive psnacea, and it never deceives.

"PERRY DAVIS' PAIN-KILLER is really a valuable medicament, and, unlike moet of the articles of the day, is used hy many physicians. It is particularly desirable in locations where physicians are not near; and, hy keeping it at hand, families will often save the necessity of sending out at midnight for a doctor. A hottle should be kept in every house."—*Boston Traveller.*

"We have tested the PAIN-KILLER, and aseure our readers that it not only possesses all the virtues claimed for it, hut in many instances surpasses any other remedy we have ever known."—*Herald of Gospel Liberty*

SEVEN SAFEGUARDS AGAINST CONSUMPTION are nnited in *Hale's Honey of Horehound and Tar*. It calms the most violent cough and cures the worst colds in a few hours, and averts all danger. Crittenton's, 7 6th Avenue. Sold by all Druggists.

Pike's Toothache Drops oure in 1 minute. *

PHOTOGRAPH PAINTING done in the most satisfactory manner at 426 Kcarny street, from the smallest card to full life size, on very moderate terms by EMILY R. EAETMAN, Artist, 426 Kearny street, San Francisco. *

CONTINENTAL LIFE INSURANCE CO., No. 302 Montgomery etreet, corner of Pine, San Francisco. *

Machinery.

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

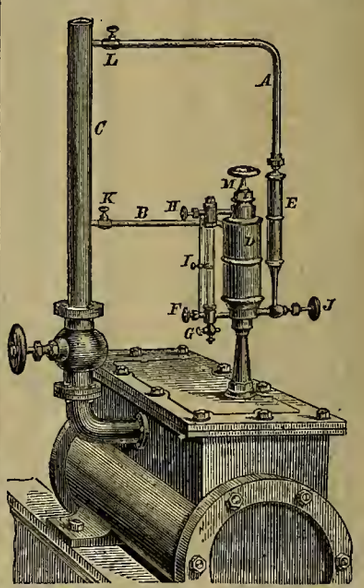
If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

For further particulars apply to

R. HOSKIN, Dutch Flat,
R. R. & J. CRAIG, 304 Montgomery st., S. F.
Or WILLIAMSON & CORY, Marysville.

Dutch Flat, August 1, 1873. 6v27-2m

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

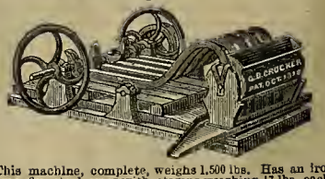
Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; K, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

---

CROCKER'S PATENT

TRIP HAMMER QUARTZ BATTERY.



This machine, complete, weighs 1,500 lbs. Has an iron frame, five steel arms with stamps weighing 17 lbs. each, which strike 200 blows per minute, in a mortar provided with screens on both sides, and crushes FINE 600 lbs. per hour, requiring one-horse power to drive it. Has been thoroughly tested, and is guaranteed to give good satisfaction. PRICE, $400.

G. D. CROCKER,

7v25-tf JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottome, as desired.

This Amalgamator Opsrates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces,—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

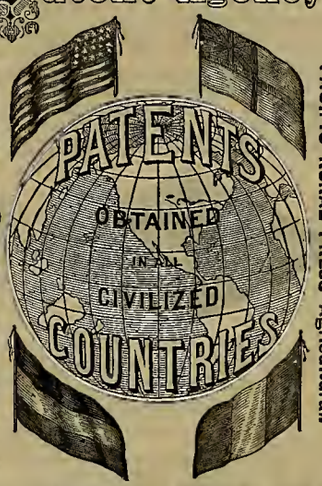
DEWEY & CO'S
SCIENTIFIC PRESS
Patent Agency.

SCIENTIFIC PRESS—Mining and Mechanical.



PACIFIC RURAL PRESS—Agricultural.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in *all civilized countries*. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. ADVICE AND CIRCULARS FREE.

DEWEY & CO.,

At the lowest Market Prices.

HALLIDIE'S
Patent Endless Wire Ropeway.
Covered by Numerous U. S. Patents.

IMPORTANT TO
Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN—My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freiburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear ont. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, O. O. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO.,
Little Cottonwood, Utah,
Superintendent's Office, Sept. 23, 1872.

T. M. MARTIN, Esq.—SIR: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a cheap and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 6, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 22, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,
113 and 116 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE 113 and 116 Pine St.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, DECEMBER 20, 1873.

VOLUME XXVII Number 25.

Wright's Bucket Plunger Steam Pumps.

Several varieties of Wright's bucket plunger steam pumps are manufactured by the Valley Machine Co. of East Hampton, Mass. They are extremely simple and compact, vertical steam pumps provided with a crank and fly-wheel. The pump is of the combined piston and plunger variety, and has but two valves, though possessing the same advantages as respects a steady delivery, as the ordinary double-acting pumps. It is a double-acting piston pump, the piston having a trunk on top. It has but one receiving and one discharge valve. The water is received only on the upward stroke, the amount being equal to the full capacity of the cylinder; only one-half, however, is discharged, owing to the smaller area of the upper side of the piston. On the downward stroke the water in the cylinder is forced out by the piston, one-half being discharged and the other half flowing into the upper end of the cylinder. It is well-constructed, compact and in a convenient form. The judges of the American Institute Fair, N. Y., in 1871, considered it as effective as the best of the *four* valve double-acting pumps now in use, with the advantage of having but two water valves to keep in order or to cause trouble.

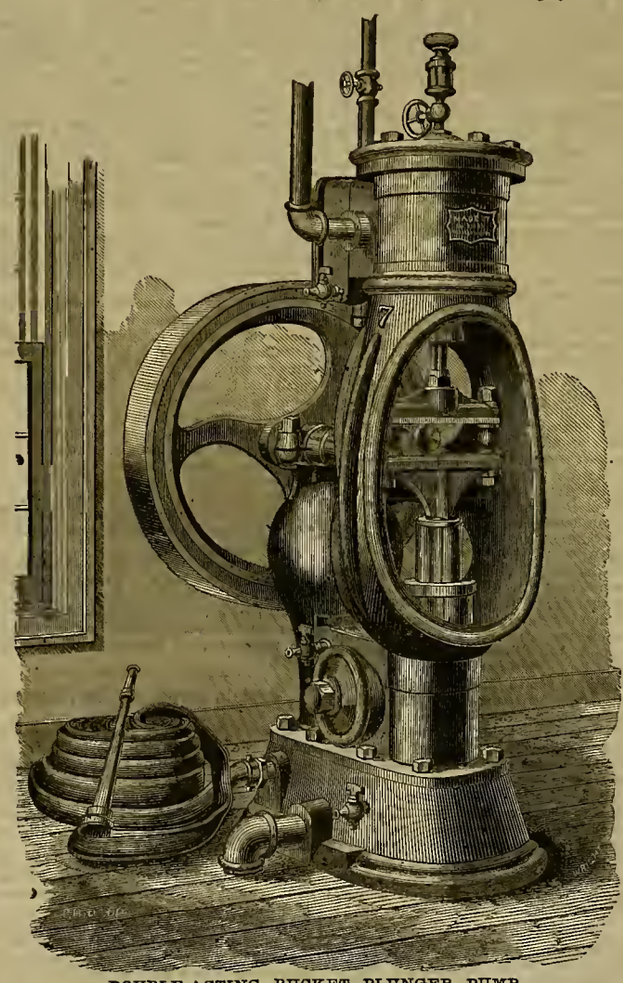
It is well known that but a small proportion of the power of the engine of a steam pump is expended in getting the water into the pump cylinder through the suction valves, most of the power being used in discharging it; in this pump the water cylinders are made twice the area in comparison with the steam cylinders of the ordinary double-acting steam pumps. By this means one-half of the number of water valves is dispensed with, as the quantity discharged in the upward stroke is thrown out through an opening in the top of the pump cylinder and does not pass through the valve opening; hence the advantage of the bucket plunger.

The particular style of bucket plunger pump illustrated on this page is called the fire pump. It will take water readily and can be run with the greatest rapidity without jarring or thumping. As it is made for service of the hardest kind there is little danger of breaking down at a critical moment. The manufacturers of these pumps exhibit numerous testimonials to their efficacy.

New Mining Bill.—Now comes some Chicago man who wants to put a little tax on the mines in the shape of a new law. The individual in question is the Hon. Jasper D. Ward of Chicago, who intends introducing a bill in Congress to amend the mining law so as to compel mining corporations to pay for their lands, which they now neglect to do. The less legislation there is on the subject of mining, the better mining interests are off as a general thing, especially when men who know nothing about mining attempt to give themselves prominence by mis-directed efforts. Miners have enough work to develop their mines without having additional burdens placed upon them.

The American Trade Dollar has been officially adopted by the Chinese authorities for payment of duties and general circulation. An assay has been made by the Chinese officials at Canton, by which it was shown that one hundred of these coins are worth 100.07 new Mexican dollars, and 101.48 old Mexican dollars. A proclamation has been issued by the viceroy, forbidding the manufacture of spurious imitations, and he orders that the dollar must not be looked upon with suspicion.

Coal.—We received this week some specimens of coal from a vein situated near Carlin, Elko county, Nev. The mine was discovered some time since, but little work was done upon it until lately to determine its value or extent. Two tunnels have been run into the hill from the Humboldt river bottom. They are 600 feet apart, and one is 100 feet long and shows that the mine is a more extensive one than at first supposed. The tunnels tap it at a depth of 75 feet from the surface. The mine belongs to



DOUBLE-ACTING BUCKET PLUNGER PUMP.

Messrs. Parker & Moore of Carson, and A. J. Hatch of Reno, Nev. After reaching the water level, they were troubled with the flow of water and are now desirous of erecting hoisting and pumping machinery to work the mine systematically. The vein as far as prospected shows itself to be one of the largest in Nevada, but it has not been worked enough as yet to speak definitely of its size. They are unable to sink upon it for want of hoisting and pumping works.

The coal has been tested at a blacksmiths' forge at Carlin, in the machine shops of the Central Pacific Railroad. Mr. Hatch informs us that the "boss mechanic" there says that it is as good coal for welding as he ever saw. All the coal procured from the mine so far has been obtained from above the water level, for when they reached the level of the river the water came so freely as to stop work. The vein is within half a mile of the railroad, in a good location for working, and the owners want to enlist capital to invest in machinery.

The Geological Survey.

Among other matters which will come prominently before the Legislature during the present session will be the consideration of the geological survey. This matter is one of no little importance, and one which should be approached with much care and caution. The progress of the survey, thus far, while it has called forth much commendation from the scientific world, and added largely to the reputation of California as a field for scientific research, has been a failure in all those points from which it has been examined by those who have to foot the bills. The consequence is that the work is not regarded by the people of this State, or their representatives, with a very high degree of favor.

Conceding the highest meed of praise for the scientific record which the survey has made, we feel constrained to say that in laying out, and prosecuting the work, thus far, there has been a manifest disregard of the wishes of the people and the pledges and promises of the head of the survey. It was promised and expected that the work would be made, at an early day, one of practical value to the people of the State—a contribution in aid of our material wealth and prosperity. But the result has been nothing of the kind; although the world of science has been largely benefited, and the reputation of the head of the survey, as a scientific investigator, vastly increased.

In authorising the establishment of the work, some eleven years ago, it was distinctly understood that, within a reasonable time, there would be published one or more volumes of economic geology, embracing the principal mineral regions of the State, accompanied by maps and illustrations, and giving such useful generalisations, touching our great leading industry of mining—particularly that portion of it connected with our immense gravel deposits and ancient rivers—as would be of much practical benefit to the people. But no such books, maps or illustrations have yet been published, and our people still continue in as great ignorance of the geology of the mining regions as though no geological survey had ever been established in the State.

Volumes and maps have, indeed, been published which are a credit to the compilers, to the State and to the eastern artists and printers, through whose mechanical and artistic skill they have been placed before the public. And we are told that there are still other similar publications ready for the press, and awaiting only the trifling sum of one hundred thousand dollars, so as to enable these also to be placed before the public. Among these publications are volumes on ornithology, botany, paleontology, fossil plants, ichthyology, conchology, etc. Some of these are in continuation of publications already made; others new. True, volumes on physical geology, general and economical geology, with maps, etc., are also promised, which may have a practical value.

The survey has already cost something like $250,000, and the general feeling seems to be against any further appropriation, except it be devoted exclusively and honestly to the publication of something which shall be of immediate and practical value. It is well known that surveys have been made and material collected from which such publications can be prepared, and we see no reason why the next money appropriated may not be for that especial purpose alone—holding the purely scientific matter in abeyance until some fitter time, when that also may be spread before the world.

In view of these facts we fully agree with the Governor in his message, that a committee be appointed whose duty it shall be to examine and ascertain the exact condition of all these things; to determine what shall be published—when and how, and to ascertain the amount necessary to be appropriated, etc.

Dividends and Assessments.—The mining companies of this coast which are listed on the Stock Board paid in dividends in 1873, the sum of $13,440,181. Assessments levied during the same time sum up $6,671,043. This leaves a balance of $6,814,000 which stock-holders have put in their pockets. The money paid for assessments was in a great part paid out for labor, so the miners and others were benefited by it. Of course the bullion production is much greater and has been coined and distributed in commercial channels and contributed to the general prosperity of the Pacific coast, as well as the world.

The Gwin mine in Calaveras county is doing well. A short run made last week with 36 stamps, cleaned up at the rate of $900 per day. The *Citizen* says of the mine that to every Calaveras man this news is of manifold importance, as this mine is one by which all our quartz interests are judged, and its failure would be extremely disastrous in its bearing on mining operations in this county.

CORRESPONDENCE.

Our Mining Laws.

EDITORS PRESS:—I have resd the remarks in the issue of November 6th of yonr vsluable paper, under the ahove headiug, and I wish to have an opportnuity to express briefly the miners' views of the matter, as far as come within my observation. It is admitted by all that the law might be improved; but it is the best law for the miners and for the development of the mines we have had or may hope to have for some time, so far as it relates to all kinds of lodes requiring capital and machinery to work them, or gravel deposits requiring ditches and hydraulio apparatus to work them successfully. And when you go over the State, you will find these two classes of mines include niuety-nine one-hundredths of our mines. On some of the great lodes of this cosst, as, for instance, the Comstock, in Nevada, you can make a great miue and an immense property on a few hundred feet. Bnt where is there another such?

In most localities it will take a large claim, and ofteu several of them consolidated, before a company can be induced to go in and develop a property that, under a judicious expenditure of money will become valuable, whioh, in sections, could never have paid expenses.

In what were known in "'49" as placer claims, with the rocker or tom, small claims were just what was wanted for one man or company of five or ten, even, which was a large company in those days. But in these times, valnable mines are made so only hy a liheral expenditure of money; and to work them, often one hundred to five hundred men must be at work, night and day. And is it in any reepect more nnfavorahle to the prospector, that one man should he allowed to take fifteen hundred feet, thau for that one who first strikes it rich, to locate a compsny of his frieuds with himself, as he could under no law, four or five thousaud feet long, or even more, as I have known cases. He then takes deeds to himself from his friends, and has all he located. This is the way it used to be done, and would be uow, but for the United Ststes law limiting a claim to fifteen hundred feet. I have seen something of prospecting, and my opinion is, the hold, enterprising mau who drives into the wilderness, risking time, outfit, and even life itself, ought in justice to have twice as much ground as the laws allow him. You try it, Mr. Editor, one season, and you will agree with me that the pioneer prospector has little enough for his pains.

I quite agree with yon that the "tunnel right" clause of the law as far as I have observed its working does not appear calculated to benefit anyhody, not even those who locate them, aa a rule, and in many cases may have kept back work on claims which would have been prospected and developed had not the tunnel claim been in the way. But for all this and its other defects, it is in the main a good law, and let us try and amend it rather than destroy it. And I must in closing, take issue with you in your closing paragraph, that the present law, or "system as at present pursued, discourages prospecting and retards mineral developments." There never has been a year since this coast had a mine on it, that there was as much prospecting done as this year, 1873. From the coast range to Sslt Lake, and from Alaska to the Mexican line, the country has been alive with prospectors, and there never was a time in this city when there were so many good claims seeking capital to assist in opening them. The prospector is never a man that has the coin to open a claim—if he had he would not be a prospector—and when he has a good find, he at once seeks the man with the coin to join him on the best terms he can make, to develop and work that which will make both rich if so developed, but without which, is nothing better than the elephant won in the raffle. Give us miners liheral laws that we may iuduce capital to join and help us, for we cannot develop the country without it, and notwithstanding the miners of "'50," thought the mines "played out," we of "'73" think they are in their infancy, and that those who mine here in 1973 will find this a mighty couu try when compared with the present. Give ns liheral laws, and do not be afraid that any one man or company is going to swallow up or control this country. There is and will be a hundred claims seeking capital for development, for one that can find it, and for want of this capitsl the ninety-nine have to wait.

MINER.

CAUGHT OUT.—The Nevada *Transcript* says that, notwithstanding the long season of opportunity the gravel miners have had to prepare for the winter rains, the late storm which has furnished plenty of water for mining operations, has found the miners unprepared for it, and that within a circuit of six miles of Nevada City there are not a half dozen companies ready to commence washing. The South Yuba Canal Company is running most of its water to the miners of Dutch Flat and Gold Run, Placer county, who are ready to avail themselves of the increased supply.

Alpine County Mines.

We extract from a general mining review of Alpine county mines, published in the *Miner*, the following items:

Silver Mountsin district claims our first attention, for the reason thst it is the oldest district in the county, and hss stood ont in bold relief, while other less favored localities have qnietly snuk into obscnrity, or have been entirely ahandoned. During the years of the great excitement in "Washoe," when the entire population of the Pacific were mining mad, Silver Mountsin took high rank, and gave promise of that richuess and prosperity which she had never yet attained, but which is yet possible in the near future. With moderate capital judiciously expended. there are many mines in this district that could be made to yield fair returns to their owners, and thus add to the bullion product, which to a great extent is the vital element of our national finances.

The Mountain company is one of the oldest and most prominent locations in the district, and for yesrs was held in high estimation by the owners, and looked upon with favor by all mining experts who ever examined into its merits. A tunnel was driven through the ledge at an altitude of over 1,000 feet above the town, which demonstrated two things—first, that they had a true fissure vein, and second, that it carried the precious metals in paying quantities. The cost of building a road to the mine on this high level, the comparatively limited amount of ore that could be extracted above the tunnel level, and the expense of erecting hoisting machinery to work below that level, led the company to suspend operations at that point snd to drive a long tunnel from the base of the mountain to onen up their precious treasure at a depth commensurate with its magnitude. With the light of experience the managers of the mine had at that early day in silver mining, their acts were in conformity with puhlic opinion, and therefore free from that odium and censure which has been so freely vented upon their folly, as it is now termed. After a perseveraunce of six or seven years in horing into one of the solid ribs of the Sierras, the company became too impecunious to go further, and thus the work stopped at a point just short of fruition. With the acquired experience of the prosent day in this specics of mining, and tho modern appliances in extracting and transporting ore over heretofore inaccessihle routes to the plsce of reduction, this mine might be msde a good paying investment.

The George Washington, in the same mountain range with the Mountain mine, is another location that once excited great hopes in the breasts of its owners, and caused them to expend a largo amount in its development. This too, like ite predecessor, never repaid the outlay upon it; not because there was not ore in paying quantites in the mine, but because in that day of limited knowledge in the efficient working of refractory ores it could not be worked at a profit. A test of the common grade ore as it comes from the mine was made hy B. E. Hunter, Esq., at the Scheuectady Co's mill, the past summer, aud gave a return, hy the wet method, of a fraction over $23 per ton. It is understood that a Chicago company have either bought the mine or are negotisting for it.

The Pennsylvania mine, on the opposite side of the town of Silver Mountain, and ahout two miles therefrom, is another old location upon which a large amount has been expended, under the exciting stimulus of a bold outcrop, showing good evidences of richness when once fairly opened up. A tunnol of about one thonsand feet was driven throngh the solid granite, piercing the ledge at a vertical depth of ahout eight hundred feet. At this point the ledge was found well defined and csrrying ruby silver in limited quantities. When it cost $25 per ton for reducing ore at the local mills, moderate grade ore could not be worked, so this promieing mine, like its predeceesors, had to succumb to the imperious law of destiny. A recent working of the average ore of this mine at the Schenectady mill gave a yield of over $50 per ton. The owners of the mine, being few iu nnmber and poor m n, are compelled to wait for the influx of capital to make their mine available.

The Scandinavian Canon.

In this interesting locality are situated the only active mines in the district. If reports are true, this region is destined to prove a second Ophir. The mines are numerous aud carry large quantities of the various grades of ruby ore from the eurface down. We are not sufficiently well versed in the stage of development in this locality to enter at all into details, hut hope to see a yearly review of operations in this quarter published in the *Alpine Chronicle*.

MINING SURVEY COMPLETED.—We understand that Col. Lewis has completed the underground survey of the boundary line between the Crown Point and Belcher mines. The colonel is a veteran surveyor, and is held in high repute hy his hrother surveyors. His survey no douht will he sccepted as authorativo in determining the boundary line between the above named mines.—*Gold Hill News.*

N. G. ANDREWS hss been appointed foreman of the Savage mine, in place of Mr. Balch, who has gone to the Crown Point. Mr. Andrews is a thorough miner, and was for a long time connected with the Crown Point mine.

The Belmont Mine.

We extract the following description of this now famons mine from the Reese River *Reveille* of the 5th instant:

Entering the main incline, we descended until reachiug the 240-ft. or water level, where we alighted and traversed the drift, which is cnt through the ledge in a northerly direction, a distance of 517 feet to the winze, in which the marvelously rich body of ore now in sight waa struck. Note—It was in this 240-ft. level, at a distance from the incline, in a northerly direction, of 550 feet, that a body of ore 270 ft. in length and seven ft. in width was extracted last spring, and, as the strike in the winze, 80 feet below, is undoubtedly a continuation of the same chimuey, it is expected that the hody below will pau out at least 270 ft. in length.

Descending the winze we find that the ledge —which is a true fissure vein—has an angle or dip to the eastward of ahout 40 degrees for a depth of about 45 ft., when it suddenly takes a turn to the westward, assuming an almost vertical position. At the bottom of thie eight-ft. winze, a cross-cut has been rnn through the ledge, showing extremely high grade ore for a width of seven feet—the ore consisting of heavy black sulphurets, hardly a piece of which but shows wire silver. From thie croescut a drift has been run, north snd south, a distance of 175 ft. in all, stripping the ledge for that distance. Throughout the entire 175 ft. the ledge shows the ssme quality of ore, estimated to mill an average of $300 per ton—in our opinion, a low estimate. Three crosscuts have been run through the chimney which show a width of from 6 to 8 feet from wall to wall. From the winze level—that on which the ore body is exposed—a small winze 24 ft. in depth hss been run, and borings msde, which display ore of the same quality as that above. Wherever the ledge has heen struck it shows ore of the same quality. One hundred aud sixty feet below the 240-ft. or water, level (400 feet depth of incline) a level is being run, which is known as the lower level, which will tap this rich chimney. When this level is completed, stoping will he commenced and an enormous amount of ore can he extracted. It is expected that this level will be completed early in January.

The strike is in what is known as the Moore and Martin ground of the Belmont company, a coudensed history of whioh I will give in another plsce.

No ore is being extracted from the mine at present, and the reason is obvious: the development was made in advance of the facilities for tsking ont. The only means of extraction now existing is the 80 ft. winze—which is small and through which but a small quantity could be hoisted daily; thence, it would have to be transported a distance of 517 ft. along tho 240-ft. level to the incline, and hy means of the incline to the surface. From this, it will be seen at a glance that the expense of extrsction would necessarily be great and the amount capahle of being hoisted insignificant. When the connecting drift, or lower level, reaches the ore body, then ore csn he extracted cheaply and in large quantity.

Of the value of this immense deposit, or chimney, of ore in the Belmout mine there can he no doubt. That it is hoth rich and extensive is patent to the most casual observer, and when once the extraction of ore is commeuced, the shipments of bullion will astonish the world.

Captain Forbes vs. the Flagstaff.

On Saturday last an attachment was issued against the Flagstaff Mining Company at the suit of Chas. S. Forhes, lately representing the company as its agent. The attachment was served hy taking posessiou hy the officers of the law of a large amount of hullion, ore and other property of the company. On yesterday the company, by its attorneys, moved hefore Judge McKean, at Chambers, to discharge the attachment, on the ground that the debt was not dne, and thst it was secured by mortgage.

The connsel for the plsintiff stated in the course of an application to postpone the hearing that they were not aware when the suit was brought of having their client's debt secured by mortgage—and it would seem that the probabilities are that the suit will have to be discharged. The case was postponed one week to give Capt. Forhes time to arrive from San Francisco, and ascertain whether he has a mortgage to secnre his claim. And the plaintiff was also required to give an additional bond for damsgee in the meantime. The suit is for the sum of about $18,000, and it seems somewhat strsnge that an attachment should have been levied against a company as prosperous as the Flagstaff is, unless there was some purpose to affect the price of its stocks in the London market.

Mr. Maxwell, the superintendent of the compsny, says the operations of the mine and smelter were never more prosperous, and that it will soon be clear of all embarrassment resulting from the operations of the past eight months.—*Salt Lake Tribune.*

TEN tons of gold qnartz were recently sent from Baker county, Oregon, that netted $200 per ton, after paying all expeuses of extraction, shipment, etc.

Sheba Mine.

The Sheba mine is looking better than for some time past, snd hopes are entertained that the main ledge, dislocated by a dyke or "cross course" in the old works, has again heen found. At any rate, ore hss been discovered at a greater depth than ever before, and as the manner of its discovery might be of interest to prospectors, we will give the particnlars: In the early days of mining in this county, the Sheba was one of the most prominent and promising mines in the State, and sold readily at from $600 to $700 per foot. Large bodies of ore were developed hy a tunnel on the vein from the croppings to a considerahle distance undergrouud, from which sufficient ore wae extracted to run a ten-stsmp mill steadily for several months. At this juncture, when feet were high and everything running smoothly, the ledge was intersected by a "cross course." The superintendent and foreman being inexperienced miners, were at a loss what to do to recover the ledge, and after spending several thousand dollars in searching for it, on the "going-it-blind" system, the company, tired of assessments, suspended work on the mine. Several years afterwards the property passed into other hands, and work was resumed in the old works. The new company confined their operations exclusively to extracting ore from stringers and portions of the main ledge left by the old company between the tunnel and the surface, and made it pay. Recently, however, they concluded to drain a shaft sunk by the old company, in the tnnnel, and drift from it in the direction in which the ledge should be beyond the "cross course." Accordingly the shaft was drained and a drift run from it into the hill, which, at a distance of twenty-five feet, cut a vein of excellent ore, supposed to be the ledge lost in the upper works. Shonld their surmises prove correct, it will show how inexperienced superintendents and poor management depreciate the value of mining property; but whether the vein discovered in the drift is the main ledge or not, it contains sufficient ore of a high grade to amply repay the amount expended in seaching for it, and teachea a lesson which prospectors should remember; that is, when a shaft is sunk to find a ledge, and fails to do eo, always drift from it before you abandon it. The mine is in charge of Peter Woolcock, to whose mining experience is due the recent strike.—*Silver State, Dec. 4.*

DUTCH FLAT MINES.—From Dutch Flat, wo learn through the Truckee *Republican*, there are good tidings. A tunnel ie heing run to the old Somerset claim with good prospects of a successful development. The Cedar creek gold mines and water company have been employing a great number of men during the past summer and this fall, in cleaning and repairing its different ditches, flumes and reservoirs aud fitting up the various claims preparatory to washing the coming season. This company started a bed-rock tunnel last July, to run from the mouth of Dutch Flat cañon to the Deep Shaft claim, a distance of about 3,000 feet. This tunnel is being run by hand, but a Burleigh drilling machine is now on the way, which, when it arrivea and is set up, will press the work on at a rapid rate. The motive power for the drill is compressed air, led through an iron pipe into the tunnel. The machinery will he driven by water power, of which the company have plenty for this purpose the year around, the pressure at this point being 750 feet. Aside from the rock in the face of the tunnel, four shafts are to be sunk—one of which is already down ahout 140 feet, and the tunnel run from them—it being the intention to run from eight faces so as to complete the tunnel as eoon as possihle. The face of the main tunnel is now in about 200 feet, and it is expected will he completed in about eighteen months. The compsny have not had less than fifty men in their employ during the entire summer, and the coming water season will employ about 150 men in all. The London company have hought the greatest number of mines in this vicinity, and having an immense amount of capital will work them thoroughly.

STICKEEN MINES.—The Portland *Bulletin* of December 2d says: From a private letter received hy a gentleman in this city from parties in Victoria, we learn that the mining excitement is running very high with them at present, little else heing talked of. Some eighty or ninety miners are already en route up Stickeen river, intending to go across the country on the ice. A number more are at Fort Wrangle, awaiting the arrival of reinforcements before starting out. As soon as spring opens there will undoubtedly he a rush for the new diggings. Several gentlemen in this city are quietly completing arrangements for the trip, and will probahly start about the 1st of January, aud we have heard of two gentlemen that will go up on the next steamer.

CONSIDERABLE GOLD.—Mr. Ott, assayer and refiner in this city, says the Nevada *Transcript*, informs us that in looking over his hooks, of the amount of work done by him in melting and assaying gold for various companies and the bank, since 1858, over thirteen millions of dollars have passed through his hands. Allowing one pound of gold to be worth $200, sixty-five thousand pounds, or thirty-two and a half tons of gold have heen melted and assayed hy him since that time. He has made 34,119 assays of gold, and 4,369 of other metals, and is still husily engaged in the same business.

MECHANICAL PROGRESS.

On the Use of Steel for Boilers.

From a late number of the *Deutsche Industrie Zeitung* we learn that Mr. R. L. Haswell, Engineer of the Austrian State Railway Company, spoke on this subject in the Society of Austrian Engineers. He remarked that the accidents which had occurred on railways using locomotive boilers of steel had thus far been only ascribed to the material; yet this was due, on the one hand, to the preparatory working of the plates, and on the other, to the small thickness, as well as to the insufficient mode of assorting them before they were used. The State railway thus far has used about 50,000 cwt. steel plates, among which only 200 cwt. were thrown aside during the manufacture of the boilers.

Haswell only knows of five instances where such boilers got cracks, four of which occurred in the fire-box plate and one in the cylindrical part. Haswell ascribes their faulty condition to the fact that they were rolled when too warm. This shows that even by purchasing steel plates from the most renowned establishments and of the best quality, one cannot depend on their superiority for the purpose in question, without assorting them with the utmost care, because it can readily occur that in heating the plates one or more get spoiled. Hence, in the establishments of the State railway all plates are subjected to tests for their tensile strength, before they are used. That these tests are perfectly reliable is shown by the fact that of 350 boilers consisting of steel plate, only a single one was found torn thus far, and this in the cylindrical part. The box plates not having been tested, it is readily explained that four boilers were injured in those parts. But, although these plates had undoubtedly been impaired in their strength by overheating, they would probably not have been torn if the construction of the machines, namely, the boiler supports, did not involve an immense strength.

In order to obtain steel boilers answering all requirements, only correspondingly thick plates and plates of the best material, without any addition (for otherwise the steel is not homogeneous) ought to be used; they ought to be scrupulously assorted according to the texture and tensile strength. After boring or punching they should be carefully annealed; the riveting must be formed with pedantic care, and the bending only with wooden hammers. That steel plates manufactured in Austria are of excellent quality, is proven by the manner in which boilers are there constructed; the box front plate, down cover, and the sides of the tubes are only furnished with an edge or border, while in England they are compelled to use angle iron for these connections.

Steel plates are preferable to iron plates, owing to the fact that they possess the same degree of elasticity in all directions (from 12 to 15 per cent.); in iron plates it is in the direction of the fibers, and according to Kirkaldy, about 15 per cent., but in a cross direction only five per cent. If one proceeds in the manner indicated, says Haswell, steel plates may be used with perfect safety. The boiler manufacturer has the advantage that he finds less plates to throw aside, and the railways on the other hand will have more carefully constructed, stronger and in the end, cheaper boilers.

NEW FIRE ENGINE.—A new fire engine, the invention of Mr. Thomas Atkins, civil engineer, underwent an experimental trial on Thursday afternoon in a field at Ladywell, (England). The principle consists in saturating the water thrown on the flame with a gaseous compound, consisting of 18¾ parts of carbonic acid, 1¼ carbonic oxide, and 80 of nitrogen, manufactured from charcoal, and which possesses the important advantage of very slowly effervescing, although introduced at a high pressure. Its cheapness is another advantage, the cost not exceeding 1s. for 1,700 square feet. The working standard is, 150 lbs. to the inch, but it can be stored at 1,000. The experiment was fairly successful, and quite sufficient to give the inventor a claim to the attention of the public. A pile of faggoted cornshwood and shavings, well saturated with tar, and about twelve feet in length, was set fire to, and it speedily burst into a furious blaze. Mr. Atkins then attacked it with his hose, and in a few minutes completely extinguished the flames, with the expenditure of about 17 gallons of fluid, a good deal of which was evidently superfluous. One of the great merits of this invention is the complete destruction which it causes of the asphyxiating qualities of the smoke, which is rendered capable of being breathed without inconvenience, a property of which Mr. Atkins proposes to take advantage in rendering innocuous the fatal "choke-damp" of our coal mines.—*Iron.*

THE *Colliery Guardian* of late date says: "American manufacturers have, from the first, been only placed at a disadvantage with England in one particular, and that is in the comparative dearness of labor. To overcome this difficulty has been the task of inventive ingenuity and enterprise in the States for many years past, and the result is such a substitution of machinery for hand labor, and such an application of scientific methods to economize production, as can be matched probably by no other country in the world."

Manufacture of Wood Pulp for Paper.

Among the more interesting articles at the International Exhibition in London, in the summer of 1872, was a series of illustrations of the process devised by Mr. Houghton for converting wood into pulp for paper. It is said that the difficulty heretofore in using this material for the purpose mentioned has been the necessity of using such large quantities of alkali as to make the cost of the operation too great to be generally employed, at least abroad. This difficulty has been overcome by Mr. Houghton's process, and it is expected that large quantities of wood, heretofore wasted, will be made available. Every saw-mill in the United States has an immense amount of refuse material, which it is extremely difficult to get rid of, and in many instances large fires are kept burning night and day in order to destroy it. There will be nothing in the way, it is said, of treating this refuse so as to have it rendered available for paper-making, and thus, while utilizing an immense amount of waste material, to cheapen the cost of books and newspapers. In the process of Mr. Houghton, in the first place the wood is cut diagonally by a series of knives, so that the fiber easily separates by the splitting of the grain. These slices are again broken into smaller pieces, furnishing the raw material for the next manipulation. This consists in introducing them into a patent boiler, calculated to endure great pressure, and heated by hot water circulating in pipes, which traverse it in sections throughout its length, the heat being capable of most accurate regulation. The pressure employed in the process of treating the fiber is 180 degrees, and the wood is introduced into the boiler in wire cages running upon a set of rails, the small pieces after boiling being quite soft and of a dingy color. This is next treated by means of chlorine in a vat, and the bleaching finished by the use of permanganate of potash. The material is now a soft, pulpy, and highly fibrous substance, which is next subjected to the action of a hydro-extractor, a kind of wringer, which leaves it in the shape of a damp, fleecy mass. The liquid with which the fiber has been treated is then pumped into a vat, and subjected to the action of carbonic acid gas, which solidifies to some extent the resinous particles. It is next placed in a copper boiler, and heated exactly to the boiling-point. This produces a complete coagulation of the rosin, which falls to the bottom in large flakes. No use has been, so far, found for this resin, but it is expected that before long it may become of commercial value. There are many other details in the manipulation of the fiber, for which reference must be made to technical journals.

Asiatic Mechanical Tools.

The following notes, for which we are indebted to the *English Mechanic*, may be put under the head of "progress," by a sort of Hibernianism. They show, at all events, *our* progress:

In India, the tools used by the native artificers depend a good deal on whether the workman has come into contact with Europeans to any extent. In such places as Jumalpore, for example, where the East India Railway Company have established large workshops, natives may be seen using tools of every description—blacksmiths,' carpenters,' engineers,' etc.—and turning out work in first-class style, but, of course, under European superintendence. In the villages, however, where the native blacksmith or carpenter works according to his own "lights," as his fathers did before him for centuries past, he still clings to his own tools. The carpenter's sheet-anchor, so to speak, is his adze, with which he is very skillful. His lathe consists of two upright pieces of wood, driven into the ground at the requisite distance for holding the work, with spikes projecting horizontally. The work is held between these pikes, and made to rotate backwards and forwards by a bow held in the left hand, and the string of which is passed once round the wood. The chisel is held in the right hand, and the carpenter squats on his hams and guides it with his toes. The same dodge of the bow is made to turn a large gimlet with a loose head to the handle, where we should use a brace and bit. They use saws somewhat similar to ours, only differently shaped in the handle; chisels, planes, files, etc., but principally of native make, and inferior to our tools. Their blacksmiths use wrought-iron anvils, also vices, drills and chisels. A goldsmith's tools are usually few and simple. A little miniature anvil, one or two pairs of tweezers, a few files, a hollow reed or two for blow-pipes, some charcoal, and some borax, etc., with a hammer and a wire-drawer, will complete his list. Possibly, the skilled workmen of Delhi, where the gold filigree comes from, or of Cuttack, which is celebrated for silver filigree, may have more and better tools; but in the rural parts of upper Bengal the village "sonah" or goldsmith has a very limited assortment.

LOCOMOTIVE SNOW-BROOM.—Messrs. M. C. Isaacs & Co., of Chicago, are supplying railroads with a broom made of steel wire, and designed to be attached to locomotives forward of the truck-wheels, for the purpose of keeping the rails clear of light snow and other obstructions; They are arranged so as to be lifted clear of the rails when their use is not required. They have been tried on many roads and are found to be both durable and serviceable.

WIRE netting for plastering, we are informed, is being rapidly introduced to take the place of laths. It takes less labor to place on the walls, is more continuous and will not burn. Coarse netting with one inch mesh, and made of strong wire, is found to answer best. For ornamental cornice work it is especially valuable, as it can be bent into any desired form. Secured to iron studding in a brick building, our greatest danger on account of fire would be removed. A still further application of this plan is to make round bags of wire resembling barrels and to coat them inside and out with cement. When it hardens they resemble stone barrels. Filled with sand and sunk in rows and masses they make excellent material for breakwaters. Another extension of the idea has been tried with success in England. It consists in making iron framed buildings, covering them with wire netting, and spreading concrete on both sides. It is claimed that a house, walls, floors, roofs, doors, partitions and all, has been built that is strong, firm and absolutely incombustible. Various applications of the use of wire netting, and plaster or cement, readily suggest themselves, and the matter is worthy of the attention of mechanics and builders.

COOLING RAILWAY CARRIAGES.—A totally new way of cooling railway carriages has been lately designed by Mr. Daniel Reid, of the East Indian railway. By this plan it is proposed to obtain the necessary cold—if that unscientific expression may be allowed for convenience sake—not from the evaporation of water, but from the direct use of ice. Mr. Reid proposes to establish in the break-van, as the English call the breaksmen's car, of the train to be cooled, an apparatus consisting of a coil of zinc piping, the lower part of which is immersed in water, while the upper part is enclosed in a box packed with ice. Air is forced through the coil by means of a fan, and thence conducted in flues along the roofs of the carriages with outlets into each.

SCIENTIFIC PROGRESS.

New Plan for Obtaining a Powerful Light.

Herr Edelmann, of Munich, has devised a very simple and satisfactory mode of obtaining a powerful light, well suited for photographic purposes, if the materials employed be judiciously selected. He has found that the oxy-hydrogen flame produced from common coal gas and oxygen at ordinary pressure produces an intense light, of any desired color if, by means of it, we burn a mixture of picrate of ammonia with a suitable metallic salt.

To this end a hollow cone of hard gas carbon—similar to that used in electric lamps—is prepared of the following dimensions: Hight, one and three-quarter inches; diameter, one inch, tapering to three-quarters of an inch, and pierced by a tube tapering in the same direction from half to one quarter of an inch. This conical carbon tube is placed, narrow end down, upon an upright oxy-hydrogen jet, the compound nozzle of which fits into the narrow end of the converted cone of carbon. The oxy-hydrogen jet is the usual kind of double tube, the coal gas issuing round the oxygen nozzle; and when the gases are ignited, they burn through the center of the cone, which then resembles a small carbon furnace one and a half inches in depth.

The number of these cones to be made corresponds with the number of intensely bright colored flames required. When the gases burn in the ordinary way, scarcely any light results; but in order to produce the desired effects, we spread over the inner surface of a cone, with a spatula, a paste made by rubbing together in a mortar, picrate of amonia, the metallic salt desired, and alcohol. The cones are then allowed to dry at ordinary temperature, and placed over the double tube when light is required. To produce the flame, the oxygen tube, which should be movable in a vertical direction, is raised as high as possible, the coal gas lighted, and the oxygen then turned on. By moving the oxygen tube slowly downwards, and regulating the gas supplies, the point at which the greatest brilliancy is produced can be readily ascertained. The light obtained is very intense and steady while it lasts.

If a white light be desired, sulphide of antimony or magnesium filings can be mixed with picrate of ammonia; but if it be desired to use the light for showing on the screen metallic spectra, the chlorides of sodium yellow, thallium green, iridium blue, and calcium are most suitable; while Herr Edelmann finds that the chlorates or nitrates of strontium red, barium pale green, and copper deep green, afford the most satisfactory results. For photographic purposes the antimony would be most suitable, but it should be mixed with the picrate of ammonia with caution.

This plan for obtaining a powerful metallic light is specially recommended for illustrating some of the phenomena of spectrum analysis. At present it is usual to employ the electric light for the purpose of projecting spectra on a screen in order to exhibit them to a large audience. The cost and inconvenience of the electric light are, however, so great as to debar many from trying to exhibit these beautiful experiments. Edelmann now proposes the above plan for producing intensely brilliant metalic flames as a substitute for the electric method, states that he has succeeded perfectly in projecting the spectra on a considerable scale when using the very simple and inexpensive source of light above described.—*British Journal of Photography.*

TWO LIVE FROGS DISCOVERED IN PIT WORKINGS.—The season for the "frog in the rock" discovery seems to have come again, at least if the following, from the Newcastle (England) *Chronicle*, may be taken as an index of the spirit of the press. The item has got into general circulation—we are curious to see what remarks will be made upon it. The *Chronicle* says: As the sinkers at present engaged in constructing a shaft at Mainsforth Colliery, near Ferryhill, were engaged at their work on Saturday morning last, they came upon a live frog embedded in the limestone, 26 ft. from the surface. The utmost surprise was expressed by those who discovered the strange object, which was passed from hand to hand for examination, and it soon succumbed to the rough treatment to which it was thus subjected. A second live frog, however, was discovered, near to where the first one had been turned up, on Monday morning, and the foreman sinker, William Widdowfield, at once took possession of it, and prevented it sharing the fate of its predecessor. On examination, its mouth was found to be entirely closed, the gums having apparently adhered from the length of time of its imprisonment. A nail, however, was inserted, and the cavity of its mouth was soon opened. The animal was then placed, together with a little of the limestone from which it had been extracted, in a small box, and has since shown lively testimony of the amount of activity it possesses.

LENS FIRES.—Dr. H. C. Bolton, of Columbia College, New York city, states that on a recent occasion, at 9 A. M., on entering his laboratory he found a wooden table on fire, ignition having been occasioned by the rays of the morning sun, which fell upon a glass spherical flask containing water. The flask served as a lens which concentrated the rays and set fire to the wood. The author also alludes to the statement of Lactantius (A. D. 300) who mentions the use of glass globes filled with water, to be used in kindling fires; while Pliny recommends the use of lenses for the purpose of cauterizing the flesh of sick persons. As to the latter, one Mr. Barnes, of Connecticut, took a patent in this country some five years ago for the use of lenses for the purpose suggested by Pliny. In respect to fires occasioned by lenses, doubtless there are many examples. It is well known that vessels at sea have been set on fire by the bullseye glasses used to admit light to between decks. These glasses were formerly made convex on one side, thus forming powerful lenses. In consequence of the loss of property and danger, their use has been discontinued, and thick plates of glass, flat on both sides, have been generally substituted. Captain Scoresby and Dr. Kane used to astonish the natives of the polar regions by taking blocks of clear ice and cutting them into the form of lenses with which they instantly kindled fires.

ELECTRIC TOXOMETRY.—Many years ago, Professor Edmund Davy, of Dublin, devised a simple electro-chemical method of ascertaining the presence of different metals, applied to detect minute quantities of metallic poisons. He employed a voltaic arrangement of small slips of zinc and platinum, placed in contact, and forming a galvanic circuit with the interposed fluid suspected to contain the poisonous metal. The poison was deposited in crystals on the negative surface of the slips of metal; arsenic could be detected if only the five hundredth part of a grain were deposited; in some instances he could appreciate the two-thousand five-hundredth part of a grain. These minute quantities can be detected even when mixed with ordinary articles of diet, such as wheaten flour, bread, starch, rice, potatoes, sugar, vinegar, eggs, gelatin, gruel, various kinds of wine; and also in the saliva and bile. Besides arsenic, Professor Davy experimented with corrosive sublimate, acetate of lead, and sulphate of copper, and always with the same satisfactory result. In some instances where the common tests failed to act, or only acted fallaciously, he found the electro-chemical method act with the greatest certainty.

FIRE DETECTORS.—An experimental display of some of Professor Grechi's instruments for signaling the commencement of fires in any room, or in interspaces difficult of access, has been made in one of the corridors adjoining the Machinery Court at the International Exhibition at South Kensington. Small straw fires, inflamed with petroleum, were ignited, when the instrument caused the alarm bells to ring, and notified the particular locality by the fall of a numbered disc. A lantern was also lighted in one compartment by the falling of a small weight upon glass globules of sulphuric acid. The principle of the apparatus is this: a double spiral of zinc and platinum is soldered to a disc carrying an index and a small wire contact-maker. When the spiral expands by the heat the contact-maker is turned by the motion of the spiral, thus putting in action current from an electrical battery, by which alarum-bells and signal apparatus are action. The instruments are made, and cost about 2s a pie-

Our Weekly Stock Review.

THURSDAY EVE, Dec. 18, 1873.

The Stock Market has been in a state of excitement for eome little time past hut the middle of this week hronght a reaction as far ae prices are concerned. Prices have been gradually rising for eeveral months with fluctuations of course, bnt a gradual rise neverthelese. The developments in many of the mines have inspired confidence in otber less fortunate onee, which have had tbeir full share of transactions. In fact divideuds do not seem to make much difference as far as the prices of stocks are concerned, and mines like Ophir and Savage are dealt in more than even Crown Point and Belcher.

The dividends for the month have been as follows:

NAME.	PER SHARE.	AMOUNT.
Belcher	$5.00	$520,000
Crown Point	3.00	300,000
Cons. Amador	50c	15,000
Eureka	1.00	20,000
Monitor-Belmont	60c	26,000
Total		$880,000

Assessments during the month have been as follows, amounting in all to $641,600:

NAME.	PER SHARE.	AMOUNT.
Alpha Consolidated	$3 00	$18,000
Arizona & Utah	50	9,000
Auburn Gold	60	4,000
Baltimore Cons.	1 00	64,000
Bellevue	50	4,000
Bowery Cons.	50	16,000
Caledonia	3 00	60,000
Caroline	30	9,000
Columbus Mill	60	10,000
Dardanelles	1 00	24,000
Gould & Curry	1 60	72,000
Ingomar	26	10,000
Knickerbocker	1 50	36,000
Mammoth	10	3,600
Mint Gold	10	5,000
Noonday	12½	2,500
Phil Sheridan	60	12,000
Picton	25	75,00
Pioche	1 00	20,000
Rye Patch Cons.	1 00	30,000
Senator	50	12,000
Silver Hill	2 00	108,000
Sierra Nevada	2 60	50,000
South Chariot	1 00	20,000
War Eagle	1 50	15,000
Woodville	1 00	28,000
Wonder	10	3,000

The dividends paid for tbe year ending tbis montb amount in all to $13,490,181; the total assesements for the year amount to $6,671,043. This makes a ebowing in favor of stockbolders of $6,819,000, a very good showing indeed. Of these dividende Belcher paid $6,760,000 and Crown Point, $5,100,000.

The Golden Chariot Mining Co. received on the 15th $17,804 in bullion.

The Ohollar report for the week ending Dec. 13th saye: Ore miued, 500 tone; ore forwarded to mille, 319 tons, 150 pounds; on hand at mill, 9,772 tons; average aseay of ore mined, as per oar eamples, $30 per ton. Owing to the stormy weather, teams were nnable to haul the ueual amount of ore to mills, hence tbe emall amount extracted.

The Superintendent of the Consolidated Virginia ehipped on the 13th $47,163 in hullion. The production of this mine last month was $246,000, of which $143,000 wae gold.

The fluctuations this week in prices have been somewhat remarkahle. At the latter part of the week prices dropped as stated above, but the difference hetween highest aud lowest prices during the week is quite unusual. The most marked instancee are in the Wasboe stocke. Alpha Cone. was ae high as $57 and as low ae $47; Best and Beloher, $96 and $86; Caledonia, $37 and $22½; Central, $65 and $23; Chollar, $75 and $60; Cons. Virginia, $79 and 70; Exchequer, $40 and 24½; Gould & Curry, $28 and $19; Hale & Norcroes, $54 and $43; Kentnck, $26 and $16; Ophir, $156 and $101; Overman, $60 and $42; Savage, $88 and $71; Seg. Belcher, $114 and $85; Silver Hill, $17 and $9; South Overman, $5 and $1¼; Yellow Jacket. $93 and $67; Raymond & Ely, $55 and $49.

Among the prominent advances over prices at close of last week are, Alpha Consolidated, $17; Bullion, $10; Caledonia, $14; Central, $40; Chollar, $16; Central No. 2, $13; Empire Mill, $13½; Exchequer. $15½; Ophir, $66; Seg. Belcher, $27; Savage, $17; Yellow Jacket, $19½.

MINING SUMMARY.

THE following is mostly condeneed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

MINING MATTERS.—*Miner*, Dec. 13th: The severety of the enow storm that has prevailed for the last ten days has prevented or greatly retarded work. The clean up at the Schenectady mill has beeu completed and the hullion sent to the Careon miut, but no returne have yet been received. Underground work hae been prosecuted in tbe Silver Glance, and the M. & N. W. mill only waits for the etorm to abate and the cold to moderato before commencing a short experimental run. Mr Chalmers hae ahout 100 tone of very fine lookiug rock at the Exchequer mill, which he intends to work up in a few days if the weather will permit. Some prospecting is being done in other claims with encouraging results.

STOPPED—*Chronicle*, Dec. 1st: Tbe heavy fall of snow on the ledges will prevent the survey of our minee until next June. That of the Mountain was concluded in time.

AMADOR COUNTY.

OUR MINES.—*Ledger*, Dec. 13: Ae far as we have been ahle to learn, tbe late severe storms have produced no matcrial injury, or interfered with our developed mines. Our quartz mille having laid in a winter supply of fuel and timber for the mines, work progressee regularly and without interruption from changee of weather. Since the storme set in, we have heard from hut few of our large mines, but at last reports the monthly yield came fully up to the general.

THE Kennedy mine continues its usual good yield, with the rock now in eight incr easiug in value; the ledge is 18 ft. in tbickuess, and the whole of it valuahle ore. The Kennedy, witbout boast or exaggeration, may he eet down as a first-claes mine.

THE State of Maine still continues its favorable appearance; as the lower level is driven in under the hill, the ledge increaees in thickness and value, and is now three and a-half feet wide, heing a very considerahle increase from its thickness at the ehaft; the rock ie of excellent quality, and the ledge presente all the indications of permauency. Time will prove the State of Maine to be a valuable, paying mine.

THE Volcano tunnel ie progressing rapidly, despite the storms of snow and rain for tbe past two weeks, having already been driven in over 200 ft., with the rook still eoft and comparatively inexpeneive to remove. Much depends upon this enterprise, and ite managers will pnsh the work on to completion as rapidly as poseible.

CALAVERAS COUNTY.

MINING ITEMS IN BRIEF.—*Chronicle*, Dec. 13: Duryea hae just commenced waehiug. During the ceesations of operatione enforced by the water famine through the fall months be flumed the gulch helow his mine, to facilitate the removal of tailinge, and put the claim in excellent condition for working to advantage. Work will he vigorously pnshed during the winter. Brackett & Co. are completing preparations for erecting a battery upon their tunnel claim, the gravel heing so hard it will not wash without cruebing. Active operations have been reeumed in Veith & Co.'s hydraulic in Chili ridge. During the fall the sluices have beeu raised 12 ft. to improve the "dump," and sucb other changes made as were necessary to place tbe claim in proper condition for workiug. Moser & Co. are bueily at work, with very favorable resn

where it will have to remain for some weeks before it can be hauled to the mill.

SAN DIEGO COUNTY.

JULIAN.—San Diego *Union*, Nov. 30: In Julian district, the prospect for this winter, and for the coming summer, is bright, and you may look for a larger shipment of gold bullion from this part of the country during the next six months than for all of the past year.

At the Rendy Relief mine work is being pushed ahead in the levels night and day, and sufficient money to meet expenses is being taken out with the company's little water-power mill. They intend to put up a steam mill very soon.

SAN BERNARDINO.

HOLCOMB.—The people of San Bernardino are much excited in regard to a wonderful discovery of gold quartz in Holcomb valley. The ledge is of immense size, and many persons have gone there. Measuring claims with tape line is the business of all the people. The discovery was made by Charles Carter on the 21st ult. From the amount of gold found in the valley and the gold-bearing specimens all through it, it has always been believed that a mammoth ledge was situated somewhere in the adjacent mountains. For years diligent search has been made for it, but without success. The mountain in which the ledge was discovered is situated in the eastern part of Holcomb valley, about three miles east of the Haley Company's quartz mill, and three or four hundred yards from the renowned Spanish ledge. The ledge, it is reported, projects some 60 ft. and is very nearly 30 yards wide.

TUOLUMNE COUNTY.

SOULSBY MINE.—*Democrat*, Dec. 13: Down the Davidson shaft of the Soulsby mine on Monday a fine vein of ore was struck. This shaft was being sank when work ceased on the mine three or four years ago but nothing was found until this week, by drifting south nearly two hundred feet. The Superintendent represents the ore to be of the same character and appearance as that taken out when the mine was paying.

SIERRA COUNTY.

RICH.—Cor. *Messenger*, Dec. 13: Forest city, an old mining town, which, in an early day, was the scene of great activity, and which might have been bought for a song two years ago, has taken a new lease of life and prosperity, owing to the discovery of a new mine. To say it is rich hardly covers the case. We saw a pan containing $6,000 worth of specimen gold, a good sight for a healthy eye. Mr. Stone, one of the owners of this mine, informs us that the pay dirt was so rich that one might thrust his hand into it with the eyes closed and feel out ounces of coarse gold.

LAKE COUNTY.

CINNABAR.—Napa *Register*: Mr. Crabtree, a resident of Lake, has discovered a very rich lode of cinnabar which he works in connection with others from Sacramento and Yolo county. This company have run a tunnel of 100 ft.; but in their opinion they are somewhat above the ledge, and will sink a shaft from the tunnel. They have begun a second tunnel and are fortunate enough to have struck the ledge immediately.

TRINITY COUNTY.

MINING PROSPECTS.—Trinity *Journal*, Dec. 6: Never before did the "rainy season" open better than the present one does, and never before were our mines in better condition for getting off ground and saving gold than they are this year. All the claims which were worked last year will be run on an increased scale this winter, and many new ones with flattering prospects will be opened. Our white mining population has been considerably increased since last spring by an influx of practical miners from Nevada, Placer and neighboring counties, but there will be plenty of employment for all. With the recent improvements more than double the work can be done, under other like circumstances, than in former years.

Nevada.

WASHOE DISTRICT.

SUTRO.—Gold Hill *News*, Dec. 13th: The south drift is in 175 feet in very fine looking quartz, assays ranging from $10 to $20 to the ton. A north drift has been started, which now is in 18 feet. This drift has been started with the intention of striking a body of low grade ore that was found in the old workings and which is expected to be reached at a distance of 100 feet. The drift is progressing at the rate of four feet per day.

EUROPA.—The main west tunnel is 380 feet in length. Having passed through the east or front lead, which is forty feet wide of solid quartz, giving assays of from 75 cents to $47.50 to the ton, it ran through a horse of barren rock 25 feet wide, reaching the main back ledge, which it intersects 240 feet below the surface. The drift is now about cutting into the paying portion of the ledge. It looks very promising.

HALE AND NORCROSS.—Daily yield, about 60 tons. The main incline is still progressing downwards. It is 248 feet in length below the 1,700-foot level. Work is still prosecuted in prospecting drifts, and also in the drifts on the third station level.

SUTRO TUNNEL.—Twenty eight feet have been added to the length of this prospecting work during the past week, making total distance from month to header, 5,291 feet. A small stream of water was struck last night, coming in at the bottom of the drift. The rock in the face is hard. At Shaft No. 2 they have sunk twelve feet since our last report, making total depth to date, 791 feet. Shaft No. 3 has been sunk eight feet; total depth, 459 feet. Shaft No. 4 has been sunk eleven feet; total depth, 605 feet. F. A. Benjamin, the newly appointed assistant superintendent, has entered upon his duties.

CONSOLIDATED VIRGINIA.—The mine looks well in all of the openings in the ore body. The daily average quantity of ore extracted from the 1,200-ft. level is 150 tons, of excellent quality. The branch railroad is completed to the company's ore dumps and they are already shipping ore to the Silver City mills. Work on the 1,000-ft. level is steadily progressing. They are also excavating for the station at the 1,300-ft. level.

IMPERIAL.—The main incline is making better progress in sinking, the rock being softer. At the 1,700 ft. level the west drift or cross-cut is thought to be nearing the west wall. The face is in quartz and porphyry. The south drift shows quartz seams in the porphyry, which give low assays. At the 1,500-ft. level, the northeast drift shows tough clay in the face.

GOULD & CURRY.—The drifts on the 1,500-ft. level are in the same material as has lately existed. On the 1,600-ft. level the drift advancing eastward is now in hard rock. The east drift from the incline on the 1,700-ft. level is still in hard blasting ground and is not yet far enough advanced to reach the vein. The work in all the horizontal workings is prosecuted diligently and very good progress is made.

JULIA.—The south drift and west cross-cut are progressing ahead 4 feet per day. In the south drift there is a decided improvement. The pumps have got the best of the water in the shaft, and have drained the 1,000-foot level. The drifts are found to be somewhat caved, having been filled with water for three months.

NEVADA.—The ore body in the raise above the main south drift shows improvement and is widening out as further raised upon. It is being piled on the dump for milling. This excellent chimney of ore will do doubt extend nearly or quite to the surface, about 100 feet.

DAYTON.—During the week the Woodworth mill, on the Carson river, above Dayton, has been started up on ore from this mine. About 40 tons per day are being extracted from the second and third station levels, which continue to look very promising for an extensive future yield.

BALTIMORE CONSOLIDATED.—A good body of pay ore is developed in this mine, which will be made available in due time, well repaying the confidence of stockholders. The main shaft is now down 126 feet below the third station, and being sunk deeper as vigorously as possible, the ground working well.

YELLOW JACKET.—Cross-cutting at the 1,400 and 1,500 ft. levels progresses as usual. The main incline is down 56 ft. below the 1,500 ft. level. The rock is hard but blasts well, and good progress is made in sinking. The pump manages what water comes in with perfect facility.

SIERRA NEVADA.—Daily yield between 60 and 70 tons, keeping the mill of the company steadily running. The mine is looking very well at present, and the ore shows improvement in quality.

CHOLLAR-POTOSI.—Daily yield 125 tons, assaying $32 on the average. The main south drift, at the third station, is now in over 500 ft., and in fine looking quartz. The ore producing sections of the mine still hold out well, and look promising, keeping three mills constantly running. Total yield of the mine for November, $47,270 66.

JACOB LITTLE.—The work of development and prospecting is being pushed forward at a lively rate, which promises well for the future of the mine.

JUSTICE.—Ore extraction from the Waller-Defeat section still impeded by bad roads not allowing the teams to relieve the ore dumps, which are full to overflowing. The north drift, at the 300-ft. level, continues following the ore vein. At the 400-ft. level the cross-cut east from the main north drift is still pushed ahead.

DANEY.—The new shaft down 183 ft. Water does not interfere, the rock works well, and consequently good satisfactory progress is made.

CROWN POINT.—Daily yield, 400 tons of ore, from the 1,100, 1,200 and 1,300-ft. levels. These levels are yielding their usual amount and of the usual quality. The south winze below the 1,300 ft. level continues in fine ore. The main south drift, at the 1,400-ft. level, is being pushed vigorously ahead toward the Belcher line, following the course of the foot-wall. There is no work of any amount being done at the 1,500-ft. level, owing to the heavy flow of boiling hot water. Occasionally, however, when the water recedes a little the miners go in there and work until again driven out. The pump is taxed to its fullest capacity. The mills on Carson river have been retarded materially by the present cold snap, but the mills in Gold cañon keep running up to their full capacity.

ARIZONA, UTAH AND GLOBE.—The 400-foot level of the west drift of this mine and the drift south from the incline during the week have advanced about 4 feet per day. The faces of both drifts are in low grade ore.

SAVAGE.—The main incline still progresses downward at a goodly rate, the rock at the bottom working well.

BELCHER.—Daily yield 500 tons. The main incline is down 211 feet below the 1,300-foot level. A connection will be made this month between the main incline and the ore stopes of the 1,300-foot level. The main drift south at the 1,300-foot level is in 518 feet from the Crown Point line, and still in fine looking quartz, with streaks of good ore. The drift north to meet it from the incline is in 223 feet, and is being pushed ahead with all possible speed. The winze from the 850-foot level is now down 47 feet, and the raise from the 900-foot level, to connect, is up 82 feet. The winze below the 1,200-foot level is down 133 feet, still in fine ore. The prospects of the mine are very flattering throughout.

OPHIR.—Three main drifts are being carried southward from the 1,300, 1,500 and 1,700-foot levels. These drifts are approaching the south line of the mine. In a short time this work will be completed, when cross-cutting will be commenced. Still sinking the main shaft, which is already down 50 ft. below the 1,700. A strong stream of water has been encountered at the 1,700-ft. level. At the 1,465-ft. level the drift south is now in a heavy body of solid quartz which gives low assays, and looks promising for the development of a deposit of good-paying ore. The Ophir looks better now than it has for many months past.

OVERMAN.—No change of interest to report as to the condition of the drifts west and other prospecting operations at the 1,000 and 1,200-ft. levels. They are making the usual good progress.

TYLER.—The west drift has advanced 20 ft. during the week. The rock is hard but works well. In the east drift the ground remains the same as last week.

KOSSUTH.—The main west drift from the first station continues in good blasting ground.

KNICKERBOCKER.—The erection of the new hoisting works is being pushed vigorously to completion.

AMERICAN FLAT.—The main southwest drift at the 400-ft. level still shows improvement. No cross-cutting as yet.

Arizona.

WALLAPAI DISTRICT.—Pioche *Record*, Nov. 23: From Mr. Archer, recently from Arizona, we gather some interesting items from that Territory. Robert Stein, who is known to many in Pioche, is working twenty men in the Keystone mine at Mineral Park. He is sinking a shaft and at the same time is taking out shipping ore. The Lone Star mine, also at Mineral Park, is now under the superintendence of Mr. Munn, just returned from San Francisco, who has all the machinery necessary and ample means for developing the mines. Captain Hardy, formerly of Forrest Hill, Placer county, Cal., is also in Wallapai District. He will erect hoisting works and work on the Fairfield mine this winter.

ORNAT.—The Ida, the '63 and the Cupel will all be worked this winter. Charles Gross, late of Ehrenberg, has been running arastras very successfully during the past summer.

CHLORIDE.—Wm. Tolls, an old White Piner, is getting up a cabinet of Arizona minerals (Wallapai and surrounding districts especially) which are intended for exhibition at the Centennial Celebration for 1876. He is a very wide-awake, active man, who never waits for opportunities to do something, but makes his opportunity.

CEDAR DISTRICT.—The Hibernia mine, purchased lately by Col. Raymond, has a shaft about 60 feet deep, and is in a fine body of ore. Mr. Severs, formerly an amalgamator in one the mills at Bullionville, is Superintendent of the Hibernia. He is a very energetic man, and under his management the mine will be worked to the best possible advantage.

There are also a number of arastras in the district, which are in constant and successful operation.

Colorado.

GILPIN COUNTY.

CENTRAL.—Colorado *Review*: The strike in Central has resulted in the stoppage for the winter of the Leavitt mine. The pumps have been hoisted from the shaft. The Waterman-Kansas has been completely drained, and is producing some very fine ore.

Several other lodes have been stopped by the strike, but the production of the mines has not been lowered as much as might be expected.

Early in the month the Brighton and Syracuse claims on Bobtail Hill were sold to some Trenton (N. J.) capitalists, and work is to be prosecuted upon them steadily through the winter.

The Cameron diggings below Black Hawk have been leased to a party of Chinamen for the winter. It is also reported that some owners of ground further down the creek propose importing Chinese labor in the spring to re-open their long forsaken patches. The bank shipments of gold bullion during the month have amounted to about $80,000. The Boston & Col. Sm. Works have been working steadily upon their stock of matte, turning out silver bullion, the product mostly of Boulder and Clear Creek county ores. The furnaces and apparatus for refining gold are not yet in shape.

Good ore, averaging nine ounces per cord, is coming from the 600-ft level of the Burroughs mine.

BOULDER COUNTY.

CARIBOU.—There is but little new of note at Caribou. The Blue Bird was recently sold to Southern capitalists for a heavy price, and the shaft on it, now 90 feet deep, will be sunk further, and the mine opened during the winter.

The Caribou keeps producing well, and frequent shipments of bricks pass through Boulder for the east.

WARD.—At Ward there is considerable excitement over several new discoveries of gold ledges, among which are the Morning and Evening Star, struck by Paul Miller. The Weist mill and that of Halversen & Leng, on Jim creek, have been kept steadily running for some months past on custom ores. The summer's work has shown favorably for Ward.

GOLD HILL.—The new excitement on Gold Hill is the Cash Lode, a new discovery upon which a shaft 40 feet deep has been sunk. The ore is of average grade, and attracted so much attention principally on account of its free gold specimens. It does not, we believe, belong to the tellurium belt of veins.

Idaho.

GOLDEN CHARIOT.—*Avalanche*, Dec. 13: This mine, which now embraces the Minnesota, is producing ore which yields from $60 to $100 per ton. Forty stamps, viz: the Ellmore and Owyhee mills, are constantly running on Golden Chariot and Minnesota ore. The Golden Chariot Company have leased the latter named mill and took possession yesterday. They have an abundance of supplies of every description on hand to last till next June.

SOUTH CHARIOT.—The main shaft is down 33 feet for the 8th level, showing a ledge of splendid milling ore over three feet in width. The 4th, 6th and 7th levels are being driven north with all possible dispatch, showing a fine body of rich ore in the 6th and 7th. We feel confident that the South Chariot will be one of the leading mines in camp, when properly opened.

IDA ELLMORE.—On account of changing the hoisting engine to a new bed, they have done nothing in this mine during the past week, except to keep it free of water, but operations will be resumed to-day.

MAHOGANY.—We have good news from this mine. The cross-cut connecting the shaft with the 8th level tapped the ledge night before last. At last accounts they had not cut entirely through the ledge. It is reported as looking first-rate. The cross-cut is about 42 feet in length. They have 60 feet of drift yet to run in order to connect the shaft and winze in the 8th level.

WAR EAGLE.—The main shaft is now down 83 feet, showing a 15-inch ledge of fine looking ore. During the last few feet of sinking the ledge has improved very much, and we feel confident that the next level will open up a splendid body of ore.

Montana.

THE DOG CREEK MINES.—*New Northwest*, Dec. 6: Mr. John B. Williams, of Greenwood, interviews to the following effect on the Dog Creek mines located above. There are now recorded 45 claims below discovery and 60 claims above discovery on the Right Fork and Main Fork, the upper claims being up near the summit. There are about 50 men at work and the most of them will be employed during the working weather of the winter in running drain ditches and stripping claims. There are now some 20 or 25 cabins scattered along the gulch, seven or eight of them being grouped near together. It is designed to establish a town there, and call it Adamsville after the discoverer of the gulch, Mr. Col. Adams. Since the discovery of the Betty Gilbert, Wm. Barry has struck a quartz lead on No. 3 above and is sinking on it. A considerable number of men are going in and coming out constantly. The indications are favorable for Dog Creek next year being a fair mining camp.

Utah.

TINTIC DISTRICT.

THE MAMMOTH COPPENOPOLIS.—Cor. S. L. *Tribune*, Dec. 11: Is working about 40 men, and is daily shipping about 20 tons of ore to their mill and smelter, the latter turning out about 250 pounds of crude copper bullion every twenty minutes, and running continually. I am reliably informed that Mr. Valentine, the general manager of the company's affairs in Utah, recently made a sale of bullion to the tune of $60,000.

THE CHICAGO, under the management of Col. Weightman, is being vigorously worked, with satisfactory results. The Colonel is expending considerable money on his mine, and will no doubt be handsomely remunerated.

CRIMSON MAMMOTH, under the management of Capt. Wilder, has shipped large quantities of ore the past season, and now has sufficient on the dumps to run a twenty stamp mill steadily for twelve months. This mine has been placed on the English market at a big figure.

THE Black Dragon, owned by the Shoebridge Mining and Mill Company, and superintended by Capt. Jennings, is affording large quantities of paying ore for their mill, as is also the Shoebridge mine, owned by the same company.

THE Sunbeam is continually worked, and continually paying.

LITTLE COTTONWOOD DISTRICT.

THE EMMA STRIKE.—The rumored strike in the bottom of this mine is no longer a rumor, but is true, and is said to be a body of rich ore, about ten feet wide. The truth of the size we cannot vouch for as being a fact.

THE FLAGSTAFF continues to take out ore of a good quality, and is making the necessary arrangements to ship during the winter. The usual complement of men is at work.

THE shipments for the last week are rather light, on account of the snow storm preventing teams from getting to some of the mines that have ore and are constantly shipping, such as the Grizzly, Wellington, Oxford and Geneva, Prince of Wales, Toledo, and others. The amount of ore shipped was as follows: Flagstaff, 300 tons; Emma, 80 tons; Vallejo, 25 tons; Grizzly, about 10 tons.

The Baldwin Exploring Expedition.

The Salt Lake *Herald* says: Knowing the great interest which the public have taken in the explorations, discoveries and developments by the Baldwin exploring expedition, the *Herald* has, from time to time, through the courtesy of the leader — Major M. A. Baldwin — and from other sources, published brief accounts of the whereabouts and somewhat of the doings of the party. The expedition, having closed operations for the winter, we will, this morning, give an epitome of their journeyings since they left the city last July. As our readers are aware, the company was organized by business men and capitalists of this city and of the eastern States, the objects being numerous—that of carefully and intelligently examining the discovered mines in Utah; of ascertaining the kinds and grades of ores in those mines by scientific analytical tests; of studying the geological formation of the country; of exploring the unprospected regions of the Territory; of locating mineral ledges and developing the same, and of organizing new mining districts. To accomplish all this, they were supplied with every requisite and apparatus required. A first-class laboratory, a portable furnace for making fire-assays, an outfit of materials sufficient to make three thousand assays, chemicals for making humid tests, a Liugke's blow-pipe set, and tools for both surface and deep mining, were among their outfit, thus making it one of the best prepared expeditions for the purpose which ever started out. The entire party consisted of twenty-three men, most of them inured to mountain life. They had their own conveyances, and were dependent on no one for accommodation.

For the leadership of this expedition no more competent man could be found than Maj. Baldwin, Deputy U. S. Commissioner of mines. A thorough geologist, having a considerable knowledge of the country over which it was intended to go, and withal being an active business man, he was the right man in the right place. The assayer was Professor Thos. M. Blossom, of the School of Mines, Columbia College, New York; and a gentleman who is known all over the country as a skilled metalurgist. W. T. Boardman, engineer, late of the Stewart Mill and Mining Company, Colorado, was the surveyer and engineer of the expedition.

To give a complete and full account of the journeyings of the expedition, however interesting it might be to the public, would require more space than we have to spare at this time, therefore we shall only give a brief synopsis:

Ophir.

Starting from this city last July, they first visited Ophir and Camp Floyd districts, Tooele county. Of these two popular camps our readers are already well posted from the numerous letters published in these columns. Ophir district, once the most celebrated in the Territory, has settled down to steady work, and unostentatious development. The numerous arastras in East Canon are quietly grinding out the silver from the many rich mines in the district, while the Walker mill has, until recently, been turning out numerous silver bars. To mention either of the scores of promising prospects and developed mines in the district without others would be invidious; and besides, the principal mines are well known throughout the country. Yet even a brief notice of the the district would be incomplete without it mentioned partially the Sunnyside mine, Lion hill, and owned by Mr. Warren Hussey, of this city. It was considered at the time one of the most valuable mines, not only in the district, but in the Territory; and recent developments have shown that the estimate was not too highly laid. It will require years to remove the immense bodies of rich ore to be found in the mine.

Camp Floyd.

Only a casual examination of the Camp Floyd mines was made, and from general observations the Major gives it as his opinion that there are good mines in the district, but they will only pay by deep working.

The Tintics.

In the Tintic districts, both east and west, they made careful and critical examinations of the ores, and of the developments. At the time of their visit the Eureka mine, owned by the Eureka mining company, had been developed by two tunnels, each three hundred and twenty-five feet in length, the first intersecting with a shaft one hundred and sixty-five feet in depth, showing the mineral vein to be seventeen feet wide at the intersection. Other interior openings had been made on the lode, exhibiting immense bodies of ore assaying rich in copper and silver, with a percentage of gold. From assays made on the ground sampled ores produced sixty-two ounces of silver per ton. There were five thousand tons of ore on the dump, with prospects of the pile being increased to an unlimited amount.

The Crimson Mammoth was also examined. It is on the same lode as the Mammoth Copperopolis, and in the value of its ore and the extent of its development corresponds with that celebrated mine. A shaft two hundred and sixty feet deep had been interseeted by the main working tunnel four hundred and sixty-five feet long. From the tunnel two drifts, one extending north one hundred and sixty feet, the other south eighty feet, had been run; there was also a drift from the main shaft one hundred and twenty feet from the floor of the tunnel, besides two others on the same level—one of them one hundred and thirty feet north, the other eighty-five feet south. The mine had produced about three thousand tons of ore. Since that time extensive developments have been made on both of those valuable properties, as there also have been on the other rich mines and flattering prospects in the two Tintics. A cheaper and a more rapid transportation for the ores and bullion is what is wanted to make them take leading places in the wealth producing districts of the coast.

Nebo.

The expedition next visited Nebo district, about which so little is known outside of a few directly interested parties. The mines in that camp are actually huge mountains of low grade argentiferous galena, which, owing to the absence of reduction works and the high freight tariffs, are lying there wholly useless to the owners and the country. Very little progress has been made in the way of development, the only ledge upon which any amount of work has been done, being the Olive Branch, owned by Mr. William Jennings, of this city. In this mine—which is a true fissure vein—a large body of ore has been exposed, but at present no work is being done in the district, and the only thing which can properly open the wealth lying there for the taking, is a railroad.

Beaver Lake.

Several promising prospects were examined in Beaver Lake district, situated about ten miles north of Star, in Beaver county. The only developments of any consequence are on the San Francisco, owned by Byrom & Campbell. The vein has been exposed for several hundred feet, and from a one hundred foot shaft, a number of tons of ore, working $200 per ton have been taken. The mine is now being profitably worked on a lease. Work is now being done on seven or eight other valuable prospects in Beaver Lake.

Star—The Queen District.

But of the Star, about which so much was said in praise a few months ago, Major Baldwin thinks half has not been told. He spent much time at this camp, examined thoroughly upwards of two hundred developed mines and made assays of the ores from at least that number. From his observation he has no hesitation in pronouncing Star the future "banner district" of the coast. The veins, which are generally true or contact fissures, contain every variety of ores found in the Territory, of high grade and easily reduced, some being free milling rock, and other ledges producing smelting ores. One, the Omar, owned by a couple of Germans, is turning out largely of gold, while others are silver and copper lodes. On the dumps of the mines visited, there were from fifty to five hundred tons of ore piled up, and untold wealth still in sight. The country rocks are lime, granite and quartzite. In this brief synopsis of so extensive a trip, we can give only a few of the most prominent mines in the district, which are the Hickory, Lookout, Rebel, Omar, (gold), Clipper, Temperance, Flora, Hidden Treasure, Lake Superior, (copper), and scores of others of equal value. The North Star company, owning the Hickory, have one of the most complete ten-stamp mills in the country in successful opperation, and are erecting a refining furnace for reducing their crude bullion. The company is a Canadian organization, and is developing its property with commendable judgment and energy. There is also one smelter in the district, the Shumar, located at Shaunty Springs.

In a future issue we will give an account of the expedition's observations in the iron and coal fields of the southern counties, and of some of the mining regions of Arizona and Southern Utah.

Cornucopia.—The Elko *Independent* of Dec. 6th publishes the following concerning the Cornucopia district: The Leopard company is down with an incline on its ledge 79 feet, and has a well defined ledge 3½ feet wide which averages by mill process $120 per ton. The rock adjoining the vein is soft porphyry and nothing but picks are necessary in sinking down. It has now in sight a sufficient amount of pay ore to run a ten stamp mill twelve months. Meachem & Co. had fifteen tons of ore worked from their claim at the Vance mill that averaged $160. Plummer & Co. had eight tons of float worked that went $150, and four tons from the Chloride worked $400 per ton. Harville and Co's west extension have a shaft down thirty feet on their ledge and are taking out good ore. The tunnel on the Hussey claim at a distance of sixty feet struck the vein, and is now producing good pay ore. The owners of the Black Diamond are taking out splendid ore about twenty feet below their shaft. A new claim struck by Kelso, Austin & Co. is also yielding good pay ore in liberal quantities.

Coal in Ireland.—Since the rapid and enormous rise in the price of coal began to stimulate the search after fresh sources of supply, several discoveries of new coal fields have been made in Ireland, but few attempts to open mines on a large scale. Extensive operations have, however, lately begun in the collieries to county Tyrone. This new enterprise is confined to the north, and principally to the coal fields of Tyrone. According to a recent estimate, this county contains 30,000,000 tons of excellent coal, including several seams of cannel or gas-coal. These seams are now being wrought largely, and from them are supplied nearly all the provincial gas-works in the north of Ireland. The undertakings are mostly in the hands of English companies.

Results of Concentration at the Terrible Mine.

The Colorado *Mining Review* publishes the report of the agent of the Terrible mine, Mr. Teal, on concentration. It is as follows:

Our summer's work began about the middle of May, on a stock of third-class ore of 1,002 tons. Since then, and to the close of the season's operations, we have produced of the same grade of material as follows, viz: May, ninety-six tons; June, ninety; July, eighty; August, one hundred and thirty: September, one hundred and twenty; and October, one hundred and fifty tons. Our season closed about the middle of October, and we had on hand about one hundred tons; so that altogether during the summer we have concentrated 1,568 tons. From this amount have been produced Class A, mineral, 5 tons and 1,782 pounds; B, 21 tons 1,509 pounds; C, 2 tons 1,388 pounds; D, 58 tons 1,279 pounds; E, 12 tons 24 pounds; F, 16 tons 1,071 pounds; G, 50 tons; total, 176 tons and 1,053 pounds, (or concentrating 9·3 tons of crude ore into one ton of marketable ore). This material has assayed on an average, class A, 200 ounces silver, B, 350 ounces, C, 550 ounces, D, 140 ounces, E, 350 ounces, F, 190 ounces, and G, with about $10 per ton, realizing respectively as follows: Class A, $1,178.20; B, $8,701.80; C, $1,616.40; D, $6,772.86; E, $4,804.80, F, $1,109.00; G, $500.00, or together $24,683.06; having an average value per ton of $15.74, or $3.74 above the estimation of $12.00 that was made before operations were commenced.

I believe the total production in cash will be considerably more than this, as I have valued the ores sold in England approximately, the A at $200 per American ton; B at $400, C (1st class pickings sent and sold with our 1st class shipments) at $600, and E at $400. The prices they were really sold at have averaged in every case considerably above these, so that the true returns will show a higher value per ton of crude ore treated.

The cost of the entire season's work has been $4,398.25, showing a cost for treatment of $2.80½ per ton of crude ore. We have carefully watched our tailings and slimes, and have repeatedly assayed the tailings from every stage of the process; and find them to contain from two to six ounces per ton (2,000 pounds). The largest quantity of tailings contains only two ounces per ton, and a fair average would be four ounces for the entire lot. Our slimes we have stored away for next season's work, as they did not contain enough silver to pay for treatment by hand labor.

I hope next season, by the aid of machinery, to bring the cost of concentrating the same kind of ore down to $1.50 per ton, which, such being the case, the saving effected will almost pay the cost of the machinery put in. As it is, our cost per ton compares very favorably with the prices charged by Collom of Idaho, and formerly by Wm. Bement of Georgetown, which have been respectively $3.00 to $5.00 and $6.00 per ton.

Taking the entire season's operations I think they are very satisfactory, the crude ore realizing, say (after deducting the cost of concentration, and allowing $2.00 per ton more for what the ore sold in England realized over the preceding estimation) $14.94 per American ton.

In conclusion I may say that the many difficulties I have had to contend with during the past season will be all removed before starting up again next summer. And I may therefore look forward to much better results in our next year's work.

Yours, etc.

Geo. Teal, Agent.

The following are the classes of concentrated ores:

A—Pure galena from second jigs.

B—First raggings from first or rough jigs.

C—First-class pickings, or pure ore from the rough screenings.

D—Second-class pickings from the rough screenings.

E—Clean tye-work.

F—Zinc separated from the pure galena on second jigs.

G—Third-class rock.

What is coal used for beside fuel? For making foundry facings, Cumberland or English cannel is ground by millstones, mixed with sand, sifted for use on heavy castings, and bolted for fine work. The cost is governed by the price of coal, usually a barrel of 150 to 200 lbs. sells for $3.00 a barrel. By some founders the Cumberland is preferred to Foreign coals. In using anthracite, Lehigh is thought the best; all the grit is thrown away that would not go through the bolt, clay is mixed with it at times to make it stick when the iron comes in. Soapstone, charcoal and blacklead were formerly used for this purpose. —*Coal Trade Circular.*

Dunderberg-Pleiades.—We learn a settlement has been made between these two mines, the Pleiades becoming the property of the Dunderberg owners, which puts an end to the expected litigation between these two companies. We have not been able to learn the exact terms of this compromise, but as the Pleiades seems satisfied, and the Dunderberg takes the mine, it is reasonable to suppose the arrangement has been mutually advantageous. Gradually an end is being put to the disputes between our citizens concerning mining claims, and we shall hail with joy the day when this kind of litigation shall be ended forever.—*Eureka Sentinel.*

Camp Floyd Mining Co.—Rich Productions.

The production of bullion by this mill (under the management of Henry Sewell) up to date has been fifty-six bars, or $52,415 gold, and of an average fineness, that no mill in this Territory, or Nevada has ever produced.

We understand that the work done on the mines, inconsiderable as it has been, has produced such results that the shareholders in London will not fail to be greatly elated. When we consider that all this has been done during the terrible money crisis, and without one cent having been forwarded from Loudon, and $2,500 of liabilities left by the late managament, and paid by Mr. Sewell, we cannot otherwise than say, that Mr. Sewell has done wonders. That he is a man of nerve and energy, nobody will doubt, and therefore it is not to be wondered that he should inspire all persons with perfect confidence in the success of this company.

Many mine owners seeing the great success of the mill, have come forward offering to incorporate their mines with the new company that is being formed in London. The net produce from tailings, according to Mr. Baxter, the Superintendent of this mill, will be about $40,000, and ere long a big pan will be erected, to work these only during the time that the mill is at work on ore, consequently the expenses of running this pan will be nominal. There is sufficient ore on hand, and contracted for to continue running the mill for the next two months. By that time the product in bullion will have reached the sum of $100,000. We were shown a cablegram from London, giving power to Mr Sewell to incorporate mines to the amount of $200,000 with the New Camp Floyd Mining Company. Mr. Sewell informs us that he cabled back requesting that £70,000 or $350,000 should be set aside in shares, in order to incorporate several more mines that he has been offered since he last cabled, and requested that the new working capital be increased to $100,000.

Matters look undoubtedly *couleur de rose* for poor, ill-treated Camp Floyd.—*Salt Lake Tribune.*

From Stickeen River.

We are permitted to make the following extract from Peter Cargotich's letter to a friend in Pioche, dated Bnk's Bar, Stickeen river, October 24, 1873:

Many people in Pioche may remember my expedition to this country, and therefore in these few lines I will inform you of the discovery which I made this summer in the Cassier country, 125 miles north of this place. Near this place are two creeks, named Tibert creek and Dires creek, upon the banks of which, with rockers, from two ounces to $180 a day is made to the hand. The gold is coarse —being in pieces of from ten cents to $55. One of our countryman came down to-day, with other miners, from the upper mines. He says that a man refused to work with a rocker where it only paid two ounces a day. I notice that all the miners are coming down with full purses of gold, and all report the mines looking well, being very rich and more easy to work than California mines in old times. I am waiting here, with twenty-five miners and supplies of provisions, for the ice to melt, so that I can go up to the mines. I think there will be a big rush of people here in the spring.—*Pioche Record.*

Gold in San Bernardino.—The *Call* says: Rich and therefore interesting discoveries in gold mining have been made in the county of San Bernardino, thirty-five miles north of the city of that name. Two men, Morrison and Cotter, in prospecting, struck a ledge of quartz in the Holcomb valley, high up in the mountains, and having ascertained that their discovery promised well, they came on to San Francisco and transferred their rights to Mr. S. Curtis and Mr. S. H. Baird. Those gentlemen visited the valley, and they report the ledge to be 4,500 feet in length, so far as they have traced it, 60 feet in width, and from 30 to 60 feet thick; 2,000 feet of the length crops out. A portion of the rock has been assayed in this city, and the analysis shows as high as $600 per ton, although some of it falls below $100. The mine presents no difficulties in working, plenty of wood and water being found in the vicinity. A company has been formed, under the title of the "B. V. Gold Mining Company," but it is not proposed to place the stock on the market. A quartz mill will be erected forthwith, the mill nearest the location being that which is reducing the ore of the Haley ledge. Mr. Baird was one of the first to mine in Washoe, in 1859, and he enjoys the distinction of having built the first house in Virginia City. This house is still in existence in front of the Central mine.

Mines in Amador County.—The Sutter *Independent* of December 10th has the following: We learn from Reichling of the Kennedy mine that in the 360-foot level, where the body of ore was lately struck, as mentioned by us in a late issue, the ledge is showing well, being seventeen feet in width, and rock averaging well in quality. About two feet of the ledge adjoining the foot wall, is exceedingly rich; the next four or five feet is of a somewhat lower grade, but still above the average of the rock in this section, while that adjoining the hanging wall is of sufficient richness to pay for milling.

Useful Information.

Paste for Wall-Paper.—In pasting wall-papers, posters, etc., especially where successive layers are put on, there arises a most disagreeable effluvium, which is particularly noticeable in damp weather. The cause of this is the decomposition of the paste. In close rooms it is very unwholesome, and often the cause of disease. In large manufactories, where quantities of paste are used, it becomes sour and offensive. Glue, also, has a very disagreeable odor. If, when making paste or glue, a small quantity of carbolic acid is added, it will keep sweet and free from offensive smells. A few drops added to ink or mucilage prevents mold. In whitewashing the cellar and dairy, if an ounce of carbolic acid is added to each gallon of wash, it will prevent mold and the disagreeable taints often perceived in meat and milk from damp apartments. Another great advantage in the use of carbolic acid in paste for wall-paper and in whitewash, is that it will drive away cockroaches and other insect pests. The cheapest and best form of carbolic acid is in crystals, which dissolve in water or liquify at an excess of temperature.—*Am. Homestead.*

Staining.—The following are recommended as the best black stains to imitate ebony: An excellent black stain may be got by a mixture of ponded asphalt and mineral naphtha. The proportions must be according to the degree of blackness required, the more the asphalt tha blacker the stain; but as it is very volatile, it must be mixed in a corked bottle and laid on quickly with a brush. Drop a little sulphuric acid into a small quantity of water, brush over the wood and hold to the fire; it will be a fine black and receives a good polish.

Take half a pound or so, according to size of the job, of logwood chips, and boil them with water until the extract is of a very dark color; put on three coats of this extract when boiling hot, allowing the work to get dry, and lightly sandpaporing after each coat. Then put some rusty nails into a stoneware jar and pour over them some strong vinegar; allow the nails to digest a few days; brush the solution over the wood, which will immediately become jet black. When dry it will be of a dull bluish black, but a coat of shellac will again make it like ebony. Before applying the varnish rub down the table with No. 9 sandpaper.

A New Board Fence.—I have seen the subject discussed as to the best method of setting posts for board fences for durability. I have devised a plan which I respectfully submit which I think will supersede any other, and do away with the mode now in use. Take three posts of any durable timber, four feet long; lay them on the ground near the line of the fence, nail on the board to each post; imbed a suitable stone in the ground where the post is to be set; raise the section of your fence on the same, and drive two stakes near each post; draw them tight together at the top; take a strong wire of suitable size, loop one end, bring around into the loop, loop in the other end and cut off your wire. For the second length or section, nail on to posts, elevate, properly secure the same by stakes and then nail the loose ends to the first section, and so proceed until the fence is finished. I would also recommend the stakes to be cut long enough to drive the second time when rotted off.—*Cor. Western Rural.*

Brilliant Whitewash.—Take half a bushel of unslacked lime. Slack it with boiling water, cover it during the process to keep the steam in. Strain the liquid through a fine sieve and add to it a peck of salt previously well dissolved in warm water, three pounds of ground rice boiled to a thin paste and stirred in boiling hot, half a pound of powdered Spanish whiting, and a pound of clean glue which has been previously dissolved by soaking it well and hanging it over a slow fire in a small kettle within a large one filled with water; add five gallons of hot water to the mixture, stir it well, and let stand a few days covered from the dirt. It should be put on hot.—*Farmers' Union.*

Cleansing Silver.—According to Dr. Elsner, water in which potatoes have been boiled exercises a remarkable cleaning influence upon silver ware of all kinds, especially spoons that become blackened by eggs. Even delicately chased and engraved articles can, it is said, be made bright by this method, even better than by the use of the ordinary polishing powder.

Plastic Carbon for Filters.—Two mixtures are recommended, the one composed of 60 parts coke, 20 parts animal charcoal, 10 parts wood-charcoal, and 10 parts pipe clay; the other is composed of 10 parts coke, 30 parts animal charcoal, 20 parts wood charcoal, and 40 parts short asbestos. The ingredients, except the last, are pulverized, sifted, and mixed dry in proper proportions, then kneaded with an equal weight of molasses to a plastic mass, baked in a muffle, soaked in dilute muriatic acid, washed, dried, and baked again.

A solution of five parts of borax in one hundred of water is represented to prevent the putrefactive process in meats for considerable time. Flesh dipped in the mixture and then dried, is said to resist the usual process of decomposition.

The greatest depth of the Pacific Ocean between California and China is only about two and a half miles.

Domestic Economy.

Talk to Housekeepers.

By Lorraine.

[Written for the Press.]

Mrs. Chubbs considers herself such an excellent cook that she prefers preparing most of the dishes for her table with her own hands. This is the way she cooks beefsteak: She puts on her spectacles, brings out a large frying-pan and sets it on the stove, and deposits therein four or five large spoonfuls of pork-fat or bacon-fat from one of the half-dozen grease jars kept constantly on hand. Then she cuts the steak into pieces the size of her hand or smaller. Salts and peppers each piece, rolls it well in flour, and lays it in the frying-pan, putting it down carefully, as if putting it to sleep. Then she goes out to feed the chickens. During the fifteen or twenty minutes of her absence, the steak stews and sputters, and fizzles itself quite brown and hard on one side; and when Mrs. Chubbs comes in, she turns it over and lets it sputter and fizzle itself equally hard and brown on the other side; then it is removed from the pan, put into a platter, and set into the oven to keep warm, where it manages to get another scorch while the gravy is being prepared. This *gravy* is quite an important affair. Two or three more spoonfuls of grease are put into the pan, with some water from the tea-kettle, and when this boils it is thickened with flour, and in a moment or two is ready to pour over the long-suffering steak. The color of this gravy varies from Vandyke's brown to burnt umber; and an uninitiated person would be unable to decide whether the meat so treated was originally mutton, beef, black bear, alligator, or hippopotamus. Mrs. Chubbs dwells in the civilized and enlightened city of San Francisco, where there are hundreds of cook-books to be had, and a hundred people who would tell her what the proper way is of cooking a beefsteak, if she would only ask, so there is no excuse for her stupidity; but in the country there are a great many farmers' wives who cook beefsteak very much like Mrs. Chubbs; why so many I do not know, but it is a pity to see good food spoiled in this manner. If you are in the habit of cooking beefsteak like Mrs. Chubbs, suppose you try another way, just for once, and see how you like it. A gridiron is the only thing proper for cooking steak as well as some other kinds of meat, but if you have no gridiron, and can't get any, use your frying pan, only don't put any grease in it, and don't pound the steak. Have a good fire and let the pan get "scorching" hot before you put in the steak. One side will cook in less than a minute. After it is turned over, salt it. If you like beefsteak cooked brown clear through, I am sorry for your taste, as it is better a little rare in the center. However, we will not quarrel about that. If none of the family are troubled with dyspepsia, you can put some butter on the steak after it is in the platter; but the butter had better be left out.

No thickened gravy of any fried meat is fit to be eaten by civilized people; so have the good sense not to make any. Warm the platter while the steak is being cooked, and when the steak is taken from the gridiron, or pan, it should go immediately to the table.

Mrs. Chubbs thinks a meat stew is a fine dish to have once in a while, for a change. This is the way she makes a stew:

She brings out her large frying pan and sets it on the stove; takes some cold roast meat, mutton, beef, veal or pork, cuts it into chunks two or three inches square and puts these in the frying pan with a bowlful or so of the greasy, thickened gravy left from yesterday's roast. If there was any stuffing or bread-crumb dressing left, that is scraped in also; a little water is poured in from the tea-kettle and the hodge-podge left to stew till it is time to be put on the table, which is usually anywhere from ten minutes to half an hour. When it comes to the table the meat is as tough as sole leather, and the whole thing simply detestable.

A genuine meat stew should be made of raw meat, with the bones and very little or no fat; the butcher will cut it properly for you. This should be put on to cook in a kettle or sauce-pan with cold water, and allowed to heat gradually. When it is hot it should be carefully skimmed, and allowed to simmer till the meat is tender, which will take from an hour to perhaps two or three hours, according to what kind of meat you are cooking. If any fat rises to the top it should be skimmed off. Put in whatever seasoning you like, salt, pepper,—a little cayenne, or piece of green pepper is best,—celery or parsley, onions if you like, or tomatoes.

This makes a good dish for anybody, even a dyspeptic, but is not very fashionable, because it costs so little. Twenty or twenty-five cents' worth of beef or mutton prepared in this way will make a meal for six or eight persons.

Quince Pudding.—Take a sufficient number of ripe quinces to yield a pound of pulp, to which put half a pound of powdered sugar, a half teaspoonful each of cinnamon and ginger. Mix them well. Beat up the yolks of eight eggs in a pint of cream; then add the other ingredients, stir the whole together, flour a cloth, tie the pudding in, and boil it.

Graham Bread.

Editors Press: — I am not "Mary Mountain," but am so sorry to think anybody should hunt through your columns for a recipe for graham bread without finding even the shadow of one, that I will give a recipe for making one kind of graham-bread that some people like very much; and your readers can try it. Here it is:

Four cups of graham flour; two cups of white flour; one cup of molasses or syrup; three or four spoonfuls of yeast, if you use brewer's yeast; and as much salt as if you were making any other kind of bread. This will make one large loaf. If mixed in the morning, it will not be ready to bake till sometime in the afternoon; it is usually most convenient to mix it at night. Put your flour, syrup and salt into a bowl, pan or whatever you intend to mix it in. Take about about a quart of luke-warm water, put your yeast into it, and stir it till it is mixed with the water. Then, stir this into the flour gradually. This kind of bread is not kneaded at all — it is only stirred; but it wants to be stirred pretty thick. If the quart of water is not sufficient to mix all the flour, it will do no harm to add some more afterwards. Give it a pretty good stirring—perhaps stir it for ten minutes. Then, pour it into the buttered pan or basin you intend to bake it in. Put a cloth over it, and leave it on the kitchen-table till morning. In the morning set it in a warm place by the stove to rise. When it is pretty light, bake the same as white bread.

Some housekeepers make graham bread the same as white bread—only putting in some molasses and more yeast, and taking one-third white flour and two-thirds graham. They say it makes very nice bread.

I have never made any graham gems. I ate some once, however. Perhaps they were not made properly. I cannot say as to that, but have never since felt any inclination to either eat any more *gems* or learn how to make them.

L.

[This communication was received previous to the publication of the continuation of "Farm House Chat," by Mary Monntain, in last week's issue, in which will be found other graham recipes—Eds. Press.]

Omelette.—Beat six eggs very light, the whites to a stiff froth that will stand alone, the yolks to a smooth thick batter. Add to the yolks a small cupful of milk, pepper and salt, lastly stir in the whites lightly. Have ready in a hot frying-pan a good lump of butter. When it hisses, pour in your mixture gently and set over a clear fire. It should cook in ten minutes at most. Do not stir, but contrive, as the eggs "set," to slip in a broad-bladed knife under the omelette to guard against burning at the bottom. The instant "hiss" of the butter as it flows to the hottest part of the pan will prove the wisdom and efficacy of the precaution. If your oven is hot, you may put the frying-pan in it as soon as the middle of the omelette is set. When done, lay a hot dish bottom upwards on the top of the pan, and dexterously upset the latter to bring the browned side of the omeletts uppermost. Eat soon, or it will fall.

Good Health.

The Unwholesomeness of Cast Iron Stoves.

Several years ago General Morin, with Messrs. Payen, Deville, Bussey and Rémy, were commissioned by the French Academy to investigate this subject. Experiments were in consequence instituted with stoves of cast and wrought iron, using soft coals, with the view of learning under what conditions stoves of metal become unhealthful, and to learn respecting the presence and source of carbonic acid and carbonic oxide in rooms heated by stoves. The results of two experiments, one with dry air and the other with moist, are given in the report with considerable detail. Rabbits were made to breathe the air passing over stoves of cast and wrought iron, heated to redness, and afterwards chemical examination of the blood of the animals was made, to ascertain the presence of carbonic oxide. The following words are used in giving the results of the experiments: "If the summary of the experiments made upon rabbits does not permit us to fix with any precision the proportions of carbonic oxide absorbed by their blood, nor that of the oxygen which has been expelled from it, the results all agree to show that the use of stoves of cast iron, heated to a red heat, causes in the blood, by the presence of carbonic oxide, a gas eminently poisonous, changes whose repetition may become dangerous; while the same method of investigation has not revealed analogous effects when the heat has been produced from stoves of wrought or sheet iron." In experiments made prior to the above, General Morin reached the conclusion that in surfaces of wrought iron, heated to a red heat, some carbonic oxide was produced, and gives the results in the following words: "These experiments show, like the others, that the passage of the air over cast and wrought iron heated to redness, causes the certain development of carbonic oxide, noticeably greater for cast iron than for wrought." In presenting the conclusions or results of the entire series of experiments made upon stoves of cast and wrought iron during the year, the Commission reports as follows: "The carbonic oxide, whose presence has been proved when stoves of cast iron are used, may arise from several different causes: 1st. The permeability of the stove by that gas, which will pass from the interior of the fire-pot to the exterior; 2d. The direct action of the oxygen of the air upon the carbon of the cast iron heated to redness; 3d. The decomposition of carbonic acid contained in the air by its contact with metal heated to redness; 4th. The influence of the organic dust naturally contained in the air." Another very important conclusion was reached by the Commission, given in the report in the following words: "The results show, that all stoves and heating apparatus of cast iron, and even those of wrought iron, should be lined with fire-brick, or other substances, which shall prevent them from attaining a red heat."

In this country, where stoves are more generally used, and anthracite more than soft coal is burnt, the subject has attracted more attention; but from the recent rise in the price of fuel in England, and the probable large introduction of stoves for the sake of economy, a reference to it here may not be without its use. The Boston *Journal of Chemistry* observes that all reliable experiments go to show the dangerous nature of cast iron when used for stoves or furnaces—doubly dangerous when not lined with fire-brick, and that most of the stoves and furnaces in common use, made of cast iron, have no fire-brick protection whatever, and they are kept at a red heat almost continually, adding, that no more prominent cause of disease in families exists than such devices for burning anthracite coals.

The Teeth.

Dr. Hayes, an eminent surgeon dentist residing in London, gives the following useful hints about the care of teeth. They are simple, timely, and deserve attention:

"In the first place, teeth should be fairly used. By this I mean, not made to perform the duties of crackers for nuts, experimented on to ascertain their strength, or by ladies to rival scissors in cutting thread; for rest assured—in every case, more particularly the last—the party having recourse to such practice will surely one day rue them; the teeth so unwittingly injured being always first to part company from their fellows. Those who indulge in such or similar habits may truly be called the dentist's friends. Cleanliness is absolutely essential for the preservation of the teeth. and they should be well brushed at least morning and evening, that any feculence which may be attached to them, either during sleep from the stomach, or by day from meals, may not be allowed to permanently adhere, causing, first, discoloration, then tartar, and consequently, if I may so express myself, undermining the constitution of one or more, as from their position they may be more or less liable to corrosion. In order that the teeth should look natural—that is, retain their natural color—a dentrifice free from the smallest particle of acid should be used at the matin hour, and the mouth rinsed with tepid water, for extremes of heat and cold are most highly prejudical, not only to their color, but also to their durability; and I know no method so simple of converting a really useful and ornamental set into one of pain and subsequent extinction, than the use of washing in either one or the other. The person who substitutes him or herself, to any extent, to hot soup, tea, or other drinks, assuredly rivals the friend to the dentist just named. Brushes for the teeth should be of medium substance of bristle, and those made on what is called the penetrating principle are best. I would also observe that children at an early age should be instructed in the use of the tooth brush, and taught the value and importance of teeth, in order to inculcate habits of cleanliness and a due appreciation of the ornaments of the mouth. A brush properly selected (not too hard) may be used by children of five years of age, every morning; and by being part and parcel of the general ablution, and thus directing habitual attention to the teeth, a useful and cleanly habit will be engendered which will ensure for them proper care through life."

The Onion as Food.—It is stated that the onion forms one of the common and universal supports of life in Spain and Portugal. Authority shows, according to analysis, the dried onion contains from twenty-five to thirty per cent. of gluten, and ranks in this respect with the nutritious pea and the grains. "It is not merely as a relish that the wayfaring Spaniard eats his onion with his humble crust of bread as he sits by the refreshing spring; but it is because experience has long proved that, like the cheese of the English laborer, it helps to sustain his strength also, and adds, beyond what its bulk would suggest, to the amount of nourishment which his simple meal supplies."

Liquid Nourishment for Sick Stomach.—The *Dublin Medical Journal* commends the following: An egg, well beaten up, to which add one pint of good milk, one pint of cold water, and salt to make it palatable; let it then be boiled, and when cold any quantity of it may be taken. If it turns into curds and whey it is useless.

Louis Agassiz Dead.

Verily a great man has fallen. Wherever science has a home, there will be found his mourners. No sadder announcement could have been made to the scientific world, than that which was flashed over the wires on the morning of December 14th. Wherever the telegraph reached, the sad announcement sped with lightning speed, and touched with sorrow and regret the hearts of millions. Agassiz, though born amid the Alps and adopted by America, was in every great purpose a citizen of the world. He was a true votary of science, and was "at home" wherever he could do anything to advance its cause. No man ever devoted his energies more untiringly or more successfully to its study than did Agaseiz. His whole life from his 20th year, till the day of his death in his 66th year, has been one of most intense and persevering labor, and self-denying throughout.

Unlike most of the scientists of modern times, he devoted much attention to the great semi-metaphysical question of the day—making himself an avowed opponent of Darwin and Huxley, and their supporters. He denied the fact assumed by them that species insensibly pass from subordinate to higher grades; holding to the old idea that each species had its appointed period and separate creation. He held firmly to the opinion that the book of nature and the revealed Word coincided in this particular, and deduced therefrom what he claimed as a "most palpable demonstration of the existence of a personal God, the author of all things and the Maker of the Universe." "This," he asserted, "is what I read in the works of creation."

In this discussion, however, he stood at great disadvantage before the world from the fact that he never took time to defend his position. It is to be hoped that he has left among his papers something in this direction, which will more fully define his position, and serve as words of wisdom from the greatest mind which was ever devoted to the consideration of this important and interesting subject.

The loss of Agassiz will be more seriously and irreparably felt by the world, as an original investigator and philosophical thinker than in any other direction. One of the themes upon which he was wont to dwell, was that the great want of the world was not books, but men to learn what is not yet known. Original investigation was the great need of the day; and he himself made it the great work of his lifetime. Education in the school-room and research in the study were within the ready reach of all; but there was a great need of education in the school of Nature, research and investigation among her specimens and deposits, where they lived or lay, in the broad fields or profound depths of the earth itself. Knowledge must be obtained from which to make books, to add to knowledge. It was with this view that he established his latest school of natural history on the dreary island of Penekese, where his pupils, surrounded by nature alone, could search and study, undisturbed, in the great book of nature which is there unfolded in a manner most favorable for research examination.

The death of Prof. Agessiz was not wholly unexpected, by his family and intimate friends. His great mind was too active for the frail tenement which confined it. For several years he had been threatened with softening of the brain, induced by too close an application to study. But he was determined to die in the harness, and despite the expostulation of physicians and friends he positively refused to give himself the needed rest, for a complete restoration of his health, and the verdict must be that he died of over-work. His last hours were apparently passed in unconsciousness. At 2 P. M. on the day of his death, (Sunday last,) his respiration became very weak but was soon afterward succeeded by rapid and unnatural breathing, which finally grew fainter with the deep rising thought of the patient, until about 10 o'clock P. M., when he passed away without a struggle and apparently without pain. No eulogy need be pronounced over his grave; no monument is needed to perpetuate his memory. He rests from his labors, but his works remain, and will be more lasting than iron or marble.

Big Mines and Small Mills.

[Written for the PRESS by ALMARIN B. PAUL.]

In an editorial of your issue of Dec. 6, you made some very correct observations as respects the profits of small mills, and gave encouragement for miners to drive ahead and build them, as the sure road to fortune. It called up some ideas of my own, and I concluded to enlarge a little by this article on yours.

In milling and mining I have had some experience, and I must say it well accords with your views as expressed. We want more small mills and fewer big ones, for the great success of mining enterprises as a whole.

Small mills and big mines should be the controlling idea of every man engaged in quartz mining, while just the opposite has been the prevailing mania for years past.

It is false logic, that the larger the mill the more profitable; there are many things to be taken in the calculation, which are all overlooked in estimating only running expenses, and which, if properly understood, would figure the opposite.

There is one remarkable fact which every quartz miner of experience knows, and that is—90 per cent. of all smaller institutions have proved profitable to their owners—while 90 per cent. of all larger ones, have proved unprofitable, if not a total failure—Why? Because so much capital as principal gets in, and with large capital are extra unproductive expenses; that the institution becomes involved or mine exhausted before principal can be returned.

The question may be asked: "What can be called a big mill?" I will answer that by asking: How big is your mine? A hundred-ton mill for Crown Point or Belcher, with a ledge over 100 feet wide and thousands of tons developed, is a small mill compared to a ten-ton mill for a lode, two, three or four feet wide.

A small mill, then, I will denominate as one-half less than you think your mine will justify. For instance, if your mine, properly opened, would supply twenty tons per day, you may move safely, possibly, on a ten-ton mill. The grand point to aim at in quartz mining is making sure of getting your first investment back, and the least you get in to make a reasonable start, the more certain you are of having it returned.

Then from this point work up. A mine which cannot afterwards pay for all required improvements should not have them, and a mine that will not do something for the owners' pockets at the same time, I may say, should not have them. There is another point: it is an old adage, that "what is worth doing at all, is worth doing well," but this is never applied to quartz milling, and yet the sooner observed the better headway we will make; and here I have reference to this abominable system of sluicing ores through mills. With small mills more care is taken, more appliances are apt to get into the amalgamating department for saving the metal. A smaller amount of ore well worked, in the majority of instances, and especially in gold mining, will produce as much riches as double the quantity sluiced through. It is desirable to save the highest percentage as it saves ore and exhausting mine, while rushing it, to lessen the per ton of expenses of reducing is "holding in at the spigot and letting out at the bung." A smaller mill impliss always working on pay ore, while too large a mill often requires bad as well as good ore to keep it going, thus spoiling all.

It is lamentable to look over the mining States and Territories and see the vast number of dead institutions, produced mainly by overestimated mines and underestimated expenses. In many instances from $50,000 to $250,000 have been invested, and lost, where one-fifth of this principal would possibly have produced a success, at all events would have saved a large sum from being lost.

We must stop this thing of planting such large sums *from our pockets*, into mines and mills, and adopt the policy of starting a mine as we do our boys in business—be moderate—give them a start and let them build up in greatness and wealth, by time, economy and industry. It is better for capital. It is safer for labor, and more beneficial to the country at large. There is more work in it, as there is more stability. There is more money in it, because there is more calculation. I have built big mills, and small ones, and see now that there was more ambition in the "big mill" idea than close calculation. It is so with too many. I have got over this "ambition"—experience has taught me that small mills on big mines is by far the safest. To close, I will cite a little fact which had a lesson in it for me at least.

At one time I was building a 65-stamp mill; near by a "poor miner" was building one of about two tons per day capacity. Being interested in his enterprize, as he seemed to be going it alone, one day in passing I alighted.

The gentleman remarked, that he considered it quite a compliment, that I, who was building so large a mill, should condescend to stop to inspect so insignificant a one as his. I replied, there was no two to one that he would not end the richer man of the two. I had a presentment that way. Seven years afterwards I met this same individual, with his family bound for the States. He told me how he had worked up, and reminded me of my observation to him. He said it inspired him with hope, and I then too clearly realized the truth of my own observation. So there is no use of sneering at small mills. Too many quartz men are like newspaper men—both are apt to judge of the ability, worth and prosperity by the size—forgetting that it is profit in the one, and brains in the other which tell. That more caution is being observed as respects investments in mining, is quite evident, but still it is more, in not putting money in at all, than in using it moderately. It therefore becomes the interest of every mining locality to encourage the building of mills of moderate size by incorporated institutions, and until mines can build large ones, and to popularize small mills for men of small means, and with them co-operative labor. It is the high road to fortune.

Mining Surveys.

Willis Drummond, Commissioner of the General Land Office, has transmitted to the Surveyor-General of California, an important official order in reference to the survey of mining claims. The Commissioner says information has reached that office that deputies, in surveying mining claims, are in the habit of following the direction of the parties in interest, instead of adhering to the lines established in the original location of such claims, and thus in effect, making a private instead of an official survey under all laws and regulations, whether local or general; the location of a claim in such a manner as to give notice to all the world of the nature and extent of the same is not only indispensible, but in most cases mining claims are initiated thereby, and all subsequent proceedings are based upon and must conform to such location. A failure to make and record the location in accordance with the laws and regulations in force at the date of the location, will defeat the claim, and if it is not made with such definiteness as to operate as notice to all persons seeking to acquire rights to mining lands it will be void for uncertainty. It follows, therefore, that in making surveys of mining claims, it becomes essentially necessary to ascertain the boundaries thereof as established by the original location, for the rights of the claimant are limited and defined by such boundaries. To make a survey in accordance with other lines or boundaries is tantamount to making a new location of the claim, and the rights of adjoining locators who have complied with the requirements of the law may be interfered with and defeated thereby. The practice of making surveys according to the dictation of parties in interest, instead of in accordance with the original, has already caused great confusion and been productive of great injury to *bona fide* claimants.

The Surveyor-General of California will therefore require the applicant for a survey to furnish a copy of the original record of location, properly certified to by the recorder having charge of the records of mining locations in the district where the claim is situated, and cause all official surveys of mining claims to be made in strict conformity to the lines established by the original location as recorded; and if the record of locations made *prior* to the passage of the Mining Act of May 10, 1872, is not sufficiently definite and certain to enable the deputy to make a correct survey therefrom, he should, after reasonable notice in writing, to be served personally or through the United States mail on the application for survey and adjoining claimants whose residence or postoffice address he may know or ascertain by the exercise of reasonable diligence, take the testimony of neighboring claimants and other persons who are familiar with the boundaries thereof as originally located and asserted by the locators of the claim, and after having ascertained by such testimony the boundaries as originally established he should make a survey in accordance therewith, and transmit full and correct returns of survey, accompanied by the copy of the record of location, the testimony, and a copy of the notice served on the claimant and adjoining proprietors, certifying thereon when, in what manner, and on whom, service was made.

The Act of Congress of May 10, 1872, expressly provides that "the location must be distinctly marked on the ground, so that its boundaries can be readily traced," and "that all records of mining claims hereafter made shall contain the names of the locators, the date of the location, and such a description of the claim or claims, located by reference to some natural object or permanent monument, as will identify the claim."

These provisions of the law must be strictly complied with in each case to entitle the claimant to a survey and patent, and therefore should a claimant under a location made subsequent to the passage of the mining Act of May 10, 1872, who has not complied with said requirements in regard to marking the location upon the ground and recording the same, apply for a survey, the Surveyor General will decline to make it.

The only relief for a party under such circumstances will be to make a new location in conformity to law and regulations, as no case will be approved and patented by the Washington office unless these and all other provisions of law are substantially complied with.

If the law has been complied with in the matter of marking the location on the ground and recording the same, and any question arises in the execution of the survey as to the identity of monuments, marks or boundaries which cannot be determined by a reference to the record, the deputy should take testimony in the manner hereinbefore prescribed for surveys of claims located *prior* to May 10, 1872, and having thus ascertained the true and correct boundaries originally established, marked and recorded, make the survey accordingly.

The Surveyor-General will at once issue instructions to his deputies, requiring them to abandon the practice of surveying mining claims under the direction of parties in interest, and to conform to the rules as hereinbefore prescribed.

From an examination of the returns of surveys of mining claims, the Commissioner is satisfied that in many instances the deputy surveyors certify to the value of improvements without ascertaining whether such improvements are made by the claimant or his grantors, or not. No improvements should be included in the estimate unless they have been made by the applicant for survey by those from whom he derives title. The value of improvements made upon other locations, or by other claimants, should not be taken into consideration, but excluded by deputies in their estimate of improvements upon the claim.

The Surveyor-General will so instruct deputies, and hereafter require them to certify in each instance that the improvements and expenditures considered by them in their estimate, and which they must describe in their report, were made by the applicant or by the persons from whom he derives title.

THE sand blast appears to meet with continually increased favor abroad, as it becomes better known. Our foreign exchanges teem with glowing accounts of its performances, as well as praises of the inventor, Mr. Tilghman.

The spectroscopiste give such alarming news about the rapid approach of Arcturus that positions on the lower levels of the Yellow Jacket are in request.

Exportation of iron seems, after all, premature,

Enell's Boat Detaching Apparatus.

We illnstrate tbis week a plan for detaching boats from ths tackles which has been approved by many nnderwriters and seafaring men. It is the invention of Capt. Chas. A. Enell, of Philadelphia. The neccssity of being able to detach a boat safely and quickly frem the davits, is too well known to need comment from us. With an apparatus like this on board of a steamer or ship, there will be less loss of life in case of a collision or fire, bec nse the boats are always ready for lowering; there are no tackles to attend, and all it needs is a man at each end to pnt his hands on the hooks in case there should be a heavy sea running and any danger of the boat being detached before she gets afloat.

The invention comprises the uses of automatic slip hooks and bolt in connection with a brake or winch for the purpose of lowering boats quickly and safely; the said slip hooks releasing the boat as soon as it rides on the water. By referring to the cuts the method of operation can be seen. Fig. 1 shows the boat in the act of being lowered. Fig. 2 is a view of the improved slip hook and bolt when closed.

The boat is swung hetwen davits in the usual way, except that instead of tackles the chains, *C*, *C*, are used to suspend it. One end of each of these chains is fastened to the slip hook, and the other ends pass over the drums on the winch. *D*, *E*, *E*, are brake levers to facilitate lowering the hoat. When the boat is to be lowered in a hurry, the pawls on the winch are thrown out of the ratchets, so that the boat will descend of its own weigbt, the brakes *E*, *E*, being used to check too rapid motion. As soon as the boat reaches the water the slip hooks, *B*, *B*, disengage themselves from the bolts, *L*, and consequently from the boat.

The slip hooks, *B*, *B*, Fig. 2, which move loosely in the ring above them, are so arranged that the hook part is made in a V shape, which fits and hooks into corresponding recesses in the bolt, *A*. As long as there is any weight attached to the bolt, *A*, the books and bolt will be tightly locked, as shown in the cut; but as soon as the weight is stopped in its descent, and the books still continue to be lowered, then the upper part of the bolt, *A*, will strike against the shanks of the slip hooks, *B*, *B*, and spread them, thereby releasing the boat. The grooves on the under side of the head of the bolt, *A*, are V shaped and extend upwards, and the ends of the books, *B*, *B*, are V shaped and likewise project upward. These features prevent vertical as well as lateral displacement of the books. It is impossible to disengage the hooks until the boat is fairly afloat, and thus any intentional or unintentional blows or action on the hooks, while the boat bangs above the water, cannot throw off the hooks, since to do this the boat would have to be lifted in the air to clear the bolt of the hooks.

It is well known that in the excitement incident to wrecks and other dangers ship-boats are often cleared by force; and unless the hooks and bolt have protective features, the hooks can be knocked off of the bolt by a hatchet, or pried ont of place by bars and other devices always found on ship-board. Again, by the peculiar construction stated, the rocking or swaying of the boat as it descends cannot work or disengage the parts and free the boat, and such disengagement cannot occur if the lowering boats bound or strike forcibly against the ship. The inventor, Mr. Charles A. Enell, 307 Walnut street, Philadelphia, states that he desires to dispose of State Rights in his invention.

The Amador Canal and Mining Company have completed three miles of their canal in Amador county, since November 1st; have six miles more of canal to build to complete their whole work. Their canal will be forty-six miles long; is the largest running ditch in the State, being ten feet on top, six feet on bottom and three feet deep. Will supply the Amador, Oneida, Kennedy and other quartz mines in Amador county, with motive power for machinery of mills and shafts; will supply water to extensive placer diggings, and for irrigation.

Quicksilver.—Dispatches from New York, dated December 14th, state that quicksilver sales were made of 30 flasks at $124@$127½ gold, and the price is now advanced to $130. The stock is very light. In London the cable quotation is £19 10s to £20, at which rate it would cost over $130 gold to import it here.

Utah Affairs.—There is said to be a more encouraging feeling in general business in Salt Lake city, with strong expressions of approval of the proceedings of eastern capitalists against Utah mining swindlers.

Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held on Monday evening last, Vice President Hewston in the chair. The regular order of business was suspended in orderr to make preliminary arrangements to take action in memory of Professor Louis Agassiz, deceased. A committee was appointed to prepare a memorial, to report at a special meeting to be held next Monday evening. It is the intention of the Academy to appoint a few of the members to deliver appropriate eulogies at this special meeting, which will be held in some public hall in this city.

The following new members were elected: A. G. Stearnes, life member, General B. S. Alexander, John Lewis, John Muir, Jason Springer, Daniel Swett, P. C. Landers and Dr. F. Hiller.

As donations to the museum a number of specimens of fishes and birds were received from Dr. Franz Steindachner. Several valuable additions to the library were also made.

Dr. Blake read an exhaustive paper on the geology, etc., of the Puebla range of mountains, situated in the northern part of Humboldt county, Nev.

The Puebla Mountains.

The most interesting feature connected with this range is the fact that it seems to have formed the eastern shore of an immense basin in which molten lava was poured out in eruption after eruption, until it had attained a steepness of more than two thousand feet.

BOAT DETACHING APPARATUS.

By a subsequent displacement the edges of these beds have been exposed, thus enabling us to discover the order in which the different varieties of molten rock have been poured out from beneath the solidified crust of the earth. The beds thus exposed are formed of different varieties of rock—basalts, trachytes, porphories and obsidian. They vary in thickness from two feet to a hundred, and have been formed by at least a hundred different eruptions, extending over a vast period of time, and covering a space of many thousand square miles, the probability being that they are continuous with the vast basaltic beds of eastern Oregon, through which the Columbia river cuts its way by a cañon more than three thousand feet deep. From a chemical analysis and microscopical examination of rocks taken from different levels on the side of the mountain, it would appear that in the Puebla range the order in which the different rocks were erupted is not in accordance with the system brought forward by Richtofen in a memoir published by the Academy in 1868; as, according to this system, in massive eruptions the true basaltic rocks are always the last to be ejected, whilst in the Puebla range we find beds of trachytio rocks.

The Lava Flood of Oregon.

Professor Joseph Le Conte then gave a very interesting and instructive description of the great lava flood of Oregon and western California which he had studied carefully on several exploring tours through that region. He dwelt more particularly on the lava mass at the Cascade mountains in Oregon. This lava flood, the great overflow of lava, was one of the most remarkable convulsions of nature met with on the face of the earth. The principal point of eruption from the great central caldron was at the Cascade mountains, in Oregon, which were of themselves one solid mass of lava. From this center the lava overflowed a great portion of Oregon, Washington Territory, all of northern California, and vast sections of Nevada, Montana and Idaho. The lava flood covered an area of at least 200,000 square miles, as far as explored, and it would probably be found to extend over a surface of 300,000 square miles, as its limit northward had never been determined. The depth of the lava crust varied from upwards of 3,000 feet in the Cascade and Blue mountain region, to one hundred feet and less at remote points on the outer edge of the overflow. Where the tremendous gorge of the Columbia river cut through the lava bed, it had a depth of 3,500 feet. In the latter part of his remarks Prof. Le Conte referred to the mound prairies of Oregon, which he thought were formed by erosion, giving his reasons for the supposition. We will endeavor to obtain this paper from the Committee on Publication of the Academy in order to publish it in full, as it contains matter of so much general as well as scientific interest.

A special meeting of the Academy will be held in one of the public halls of this city, on Monday evening next. The regular annual meeting will be held in the Academy's rooms on the first Monday in January, when the annual election of officers will take place.

The Naval School.—The question of a naval school in San Francisco has been considerably agitated during the past year in this city, in connection with the subject of "what shall we do with our boys." In accordance with popular sentiment, Senator Sargent has introduced a bill in Congress, to encourage the establishment of public marine schools. The bill provides that, in order to promote naval education and educate officers and seamen for the merchant marine and practical navigation, and in the arts, trades and occupations pertaining to seamanship, the Secretary of the Navy is authorized and empowered to supply on requisition of the Secretary of the Treasury or the Governor of any State, a suitable vessel with all charts, books and implements, provided the same may be spared, to be used in the establishment of public marine schools in each of the ports of New York, Boston and San Francisco, and such other ports as may be determined upon; and the material so furnished by the Government may be given to the States in which the ports are when it is decided upon; that said States will establish at their own expense a naval school for the education of youths desiring to enter the merchant marine; and when such are already engaged in that service, of suitable age, they may be offered facilities for improvement in their profession as an education. The second section provides that the President of the United States be, and is hereby authorized, on application of the Governor of any State, School Board, or other legally constituted authority, to detail an officer of the navy to act as President, Superintendent, or Instructor of the marine school established under this Act, or under the Act of the State Legislature, or of any nautical branch of any established school in the United States for the purpose of promoting knowledge in nautical matters among young men of the United States, provided the officers so detailed shall not exceed thirty. The bill was referred to the Committee on Naval Affairs.

Important Decision.—Judge Ramage has rendered a decision of great interest to owners of ditches for furnishing water, in the case of Oswald Broder vs. The Natoma Water and Mining Company. Broder brought suit to have the portion of the canal which runs through his farm declared a nuisance and abated by being filled up. This would have destroyed the whole canal. The judgment of the court is that the water company has obtained an easement over the land, and that by the act of Congress of July 26, 1866, this easement is acknowledged and confirmed. Judgment ordered for defendant. — *Sacramento Union.*

The Medical compound of P. H. Steenbergen, recently spoken of in the Press among the recent patents, as a cure for rheumatism, is intended as a cure for piles—not rheumatism

Another Grant Survey Rejected.

In our last issue we referred at length to the Cuyamaca grant, in which a survey was made that included a number of mines and mills within its boundaries, which survey was rejected by the Land Commissioner. Now comes a similar decision from the Land Office, in relation to the "Geyser case," in which the Commissioner has decided to reject the Stratton survey of the Caslamayomi rancho, California, and has directed a new survey to be made within the following boundaries: On the east, a line drawn from where Sansal creek enters the Sotoyome rancho, northerly to Main Sulphur creek, near the mouth of Squaw creek; on the south, rancho Sotoyome and Seabaco, on the north, Main Sulphur creek; on the west, foot of the eastern slops of the Sierra, with the Redwoods which lie west of the Musalio rancho. The new survey, as ordered, will exclude the Geysers property and some quicksilver mines in that locality. The eastern line of the proposed new boundary will go a little eastward of Geyser peak. The case was brought to the attention of the Land Office by parties who claim the rancho, and the contest was between the owners of the rancho and certain quicksilver mines and the Geyser property, who claimed that the rancho did not extend its boundaries so as to include the latter interest. The new survey decided upon by the Commissioner excludes most, if not all, of the contestants' claims, both the Geysers and minerals.

This Mexican grant business has always been one of the curses of California and it will be many years before the State will entirely recover from its effects. The same trouble was experienced after Florida became part of the United States, for Spanish grants were in vogue there as well as here. The Spanish and Mexican Governments in granting large tracts of land gave the grantees also a title to the minerals in the ground. Therefore parties holding title under these grantees became also owners of the minerals on the land. As official surveys of these grants had to be made in order to determine their correct boundaries, miners and others frequently settled on land which, on the survey being concluded, was found to be inside of the "grant lines." Thereupon they are compelled to give up their property. As the owners of the grants have always been dilatory in making the surveys, this has caused great trouble all over the State.

The blundering manner in which these grants were made by the Mexican Government gave the grantees great latitude as to boundaries, and the consequence has been that in numerous instances they were "floated" either one way or another to cover desirable territory. By these sharp practices grant owners were enabled to control often twice as much government land as their original title called for; since they took in all the available water on level land the surrounding hills were valueless and consequently not taken up. Any one who has traveled in Southern California may mention numerous instances of this kind.

The whole system has been one which gave room for fraud and false practices. A "subsidized surveyor could make the grant go where he liked, provided he had enough land on the original ground granted, on which to set his instruments at starting. The Land Office has been a check in a measure on the fraudulent practices. But, unfortunately, grant owners are all rich men and settlers poor ones. The grant men have money to fix up and put their cases before the Commissioner, while settlers are frequently unable even to employ counsel. As this sort of litigation is even more expensive than legal proceedings generally, great injustice has been done in many cases. The Government has even been compelled in certain instances to call in force to eject settlers and miners, from claims of this sort. The Fremont or Mariposa claim is remembered by many.

We have not the space to dilate upon this subject, but are extremely pleased to be able within two weeks, to record the rejection of two claims of this nature. The Pascoe survey of the Cuyamaca claim was all laid out before the surveyors ever went on the ground, and the subsequent decision shows that it was a "put up job." The grant men thought they could intimidate the miners and drive them off, but they didn't drive worth a cent. The decision in both these cases gives the miners a title to their ground, and prevents further litigation. We hope that ten years from now we will never hear a Mexican grant mentioned, but as our "lower country" becomes settled up, questions connected with them are bound to arise.

The Ida Mitchell mine of Placerville, El Dorado county, has been sold to an English company for $15,000 in cash.

What it Costs to Mine Coal.

The following is a synopsis of the annnal report of T. M. Williams, Inspector of the district, Carbon, and part of Luzerne counties, Pa.:

"Numbsr of persons killed, 40, leaving 24 widows and 61 orphans.

"Killed by fire-damp explosions, 8; by fall of rocks, 3; hy falls of coal, 12; by falling down shaft, 3; by mine cars in various ways, 7; killed miscellaneonsly underground, 4; killed miscellaneously ahove ground, 3; total, 40. There were 121 non-fatal accidents; many of them are very serious and may, in some instances, yet prove fatal. Burnt by explosions of fire damp, 24; burnt by gnnpowder, 3; by falls of rock, 10; by falls of coal, 23; by falhing down shaft, 3; by mine cars in various ways, 24; miscellaneously underground, 28; miscellaneously above gronnd, 7; total, 121.

"Coal produced dnring 1872 was 3,000,000 tons,—one death to each 56,000 tons, and one serious injury to each 32,000 tons of coal mined. Coal produced in 1872 was 3,250,000 tons—one death to each 81,250 tons and one serious injury to each 24,859 tous of coal mined (or rather sent to market.) The total numher of persons injured in 1871 was 9,870—death rate, 53 per cent. Do. 1872 was 9,807—death rate, 40 per cent. Decrease in 1872 was 63—decrease, 1 per cent.

"In 1871 number of persons employed inside, 6,380; number of lives lost, 47—.73 per cent. Total number of persons employed, 9,870. Total number of lives lost, 53—.53 per cent. Total number of miners employed, 2,270, included in the above aggregate. In 1872 number of persone employed inside, 6,275, number of lives lost, 37—.59 per cent. Do. outside, 3,582, number of lives lost, 3—.048 per cent. Total number of persons employed, 9,807, total number of lives lost, 40—.4 per cent. Total number of miners employed, 2,450, included in the above aggregate.

"The above exhibits that there were sent to market 381.4 tons to each person employed in and around the mines, and 1,356 tons to each miner, for the year 1872. Number of coal-breakers in the district, 50, besides 4 that were abandoned dnring the year, and 7 that are being built. Surface openings as follows: shafts, 34, including 2 abandoned, and 10 being sunk at pr sent. Slopes 37, inclnding 2 abandoned and five new ones. Drifts, 17, including 2 abaudoned. Besides the above there are nine local openings — nine drifts and one slope. Total, 115 openings, 3 abandoned —108. Fans—twelve new fans were put up during the year, and 3 now uuder coustruction, one 24 feet diameter, one 20 feet diameter, and one 12 feet diameter; otherwise veutilators remaiu about as last reported; but the ventilatore have beeu improved in many places."—*Mauch Chunk Gazette.*

India-Rubber in Burmah.

It appears that the existence of the india-rubber tree in Upper Burmah was not known, or, at all events, turned to account nntil comparatively recently. Three Europeans who were employed at the jade stone mines were forced to search about in the forest for a substance that would effectually repair a diving apparatus that tbey used in working for jade stone. The result was the discovery of india-rubber, which was found to completely answer the purpose. Our political agent at Mandalay has recently issued a report on the resources of Upper Burmah, which, among other interesting information, gives some particulars as to the preparation of india-rnbber.

The estimated numher of trees, which are chiefly situated in the Bhamo and Mogonng districts is 400,000. They thrive best in damp, moist soil, and in thick forests, shady and cool. The trees attain to a hight of from 50 to 100 cubits, being from 15 to 20 cubits in girth at the base (full grown trees), and with roots creeping over the ground for some distance. They are fit for tapping when from 6 to 10 years of age, at which time they are from 15 to 20 cubits in hight and 3 cubits in girth.

When the time for tapping arrives, incisions are made in the trnnks of the trees and in the roots above grouud. Hollow bamboo cups about 1⅛ feet in length, sloped and pointed similar to a prepared pen, are then inserted in the incisions and receive the oozing juice or milk. Three or four hundred of these bamboo receptacles are inserted in each tree. The tapping is continued for about a month, after which time it is discontinued and the wound allewed to hesl. At the expiration of another month the trees have regained strength, and the tapping is recommenced.

In preparing the india-rubber the following crnde method is observed.

Water is boiled in large iron pans, and the juice of tbe tree is thrown in, when it gradually thickens, and subsequently is dried. The india-ruhber so obtained, we are told, is being brought into local use for covering water-buckets, haekets and boxes as a eubstiute for dammer.

Captain Strover states that 70,000 viss (1 viss = 3 3-5 lhs) of india-rubber were brought from Mogoung last year, and that he himself hae ssen thirty or forty cart loads entering the King's palace at Mandalay in one day. Upper Burmah, it is computed, could produce two or three hundred tons of thie useful eubstance annually.—*British Trade Journal.*

California Prosperity.

There is more solid prosperity in California to-day than in any othsr State in the Union. Most branches of bnsiness are and have been for some time comparativsly lucrative. Thsre have not been extravagant profits; therefore business has not been forced, nor great stocks of goods unnecessarily accumulated. Speculation is not rife, and every investment is carefnlly considered before made. Mining is usually prosperous and remunerative, and great fortunes have been made by holders in those mines which are turning out wealth at an unprecedented rate. Yet wildcat stocks have not been run up to an extravagant price, and many mines with a good prospect before them are daily bought and sold at fair, hardly at equivalent, prices. Real estate is to be had at reasonable figures, and sales are only made wheu huyers who want land for improvement or permanent investment come forward. All the banks have good reserves on hand, and fnrnish money to *bona fide* customers for legitimate purposes freely at the usual rates. The building trade has been brisk, and the promise for spriug is at present a soarcity of residences, and no probability of the supply exceeding the demand for a year to come. The farmers have had a good season, and confidently expect, since the ample rain, another as good, or better. Though we have so large an element of nomades in our population, there is little distress. Compared with some other years, the applications for relief from our benevolent societies are less, and the number of admissions to our Almshouse fewer. We have our poor, like other States, and we have those unfortunates who hide away, or conceal their sorrows, and wonld rather suffer privation than expose their circumstances. But when we take the condition of our State and compare it with that of others we see a marked difference; when we compare the number and circumstances of our paupers with those of New York, Philadelphia or any great Eastern city, after allowing for the difference in numhers, we can see how much better we are off than any. The best of all is thst we are prosperous because we have been industrious, economical and prudent, and now we are reaping the fruit of a harvest which will in all human probability increase year by year until this decade is ended. How mnch longer, will depend upon the wisdom with which we use our means.—*Post.*

Romance in Mining.

The following account of a mine near El Paso—which first appeared in the *Sentinel* of that place—is quite romantic.

Sixtcen hundred and eighty was the year the monks of the order of St. Francis, who were in charge of the church at El Paso, discovered the mine. Skilled in the science of mineralogy they were not slow to discover the extraordinary richness of the vain, and their knowledge of the art of metallnrgy enabled them to work it profitably for many years. From the silver obtained from this mine, most of the churches in northern Chihushua were enriched and endowed.

The order of which Ignatius Loyola was founder, was never friendly to the Franciscans. So, when in the early part of the eighteenth century, the order of Jesuits obtained complete control in Spain, it was not long ere the barefooted Franciscans were ordered to depart from Mexico, and surrendered their rich possessions to the dominant Jesuits. When information of the coming change reached our monks at El Paso, they quietly covered the mine before us and obliterated as near as possihle all traces of its existsnce. Years passed on, and the Jesuit Fathers, if they had learned the secret of the silver treasure, never availed themselves of it. In July 1793 the mine was again opened, and worked for several ysars by a company of Mexican gentlemen, among whom was the father of our old and esteemed friend, Don Guadalupe Miranda. The works for the reduction of the ores were situated near the river banks, not far from where the Overland Building now stands. The revolution of 1824, followed by the declaration and establishment of Mexican Independence, again interrupted the working of the mine, and it was again filled np and abandoned.

The history of the mine having been learned from the church records and other sources, several gentlemen in El Paso, prominent among whom is Judge S. B. Newcomb, determined to re-open it. This was done last winter at considerahle expense; a shaft was sunk 90 feet through the material that had been used to fill up the mine, and which from lapse of time, had beccme almost as firmly cemented together as the original soil.

A Cheap Railroad.—Strangere can hardly believe, says the Salt Lake *Tribune*, that the Bingham Cañon Railroad, sixteen miles in length, was built at a cost of $141 per mile. It is the cheapest railroad ever built in any country, and demonstrates the fact that the great mineral resources of Utah can be developed in an extraordinary short time by reason of our ahility to build railroads at a cost bnt little above that of an ordinary wagon road.

Scoresby and other arctic voyagers and whale hunters have observed that whales have some means of communicating with one auother at great distancee. It is probable that the animale bellow in a tone too grave for the human ear, but quite within the range of the cetacean ear.—*Scientific American.*

The Fuel Trade of Salt Lake.

Independent of the coal trade of Salt Lake City, which has incrsased within the past fsw ysars at an amazing rate, and which, ere long, will form the subject of a special article, our importations of coke aud charcoal for the reduction of ores have also assumed such proportions that but few of our citizens understand its magnitnde; neither are they aware of the drain upon the Territory that existed prior to the panic, through the importation of coke, to aid in smelting operations.

Charcoal, for which about $20,000 a month has been paid out, is really a home iudnstry, the benefits accruing mainly to our own citizens; but with coke the case is different, onr chief supply being derived from Connellsville, at a cost of $34 per ton. The first importation of coke ever made into Utah occurred a year ago last May, Gordon & Murray then receiving five car-loads, which were sold to Mr. Lounshnry. At a low estimate, 5,000 tons per annum are consumed, which amounts to the very large sum of $170,000; nearly every dollar of which goes out of the Territory, from sheer lack of railroad facilities to our southern coal beds, where coal of the requisite quality for coking pnrposee is said to exist in great abundance, and which could he furnished at a reasonable price. Only a week ago we pubhshed an extract from the *Engineering and Mining Journal*, of New York, in which the annouucement was made that coke had been snccessfully prodnced from Colorado lignites, and the editor of that journal was of opinion that Colorado, within a year, might be enabled to control the Utah trade in coke, as well as that of portions of Nevada.

The productive demand for coke, both in Utah and Nevada, and the magnitnde of that demand, ought to act as an incentive to the directors of the Utah Southern, to pnsh their road as rapidly as possible into the neighborhood of San Pete, or wherever coal suitable for coking can be found in the southern portion of the Territory. The importation of coke, either from Connellsville or Colorado, in justice to the best interests of our Territory, ought to be stopped at the earliest practicable date. Certainly the trade is of more than ordinary importance, viewed either from a present or prospective stand-point.—*Utah Mining Gazette.*

Duration of Timber.—It is a cnrious fact, and one of great practical importance in structnral science, that in the salt mines of Poland and Hungary the galleries are supported by wooden pillars, which are found to last unimpsired for ages, in consequence of being impregnated with the salt, while pillars of hrick and stone, used for the same purpose, crumble away in a short time hy the decay of their mortar. It is also found that wooden piles, driven into the mud of salt flats and marshes, last for an unlimited time, and are used for the foundations of brick and stone edifices; and the practice of docking timber, hy immersing it for some time in sea water, after it has been seasoned, is generally admitted to promote its durability. There are some experiments which appear to show that, after the dry rot has commenced, immersion iu salt water effectually checks its progress and preserves the remainder of the timber. If care be taken to renew the coat of paint as often as it decays, wood on the outside of the buildings may be made to last for centuries; paint, however, is no preservative against the internal or dry rot, notwithstanding the opiniou so generally prevalent to the contrary.

Wages in Australia.—The average rate for miners in the Ballarat district is £2 5s per week, eight honr shifts; brakesmen get a slightly higher rate of wages. In Bendigo district, quartz miners in deep sinking for pit work, get £2 10s; ordinary quartz miners get £2 5s per week; engineers receive £3 to £3 10s. In Bendigo most of the work is done on tribute. In Alexandria, Maryborongh and Dalesford, miners receive £2 10s per week. Most of the mining work in Gipps Land is done by contract; where wages are paid, the men receive from £2 10s to £3. Boilermakers, smiths, fitters and turners, 10s to 12s per day; laborers from 6s to 7s per day. Engineere in tow-hoats, and donkey-engine drivers receive £18 per month. The average rate of wages of brass-finishers and coppersmitbs is 10s per day, the payment being 15d per hour. Owing to the meat-preserving companies not being fully employed, a good many tinsmiths are out of work at present. In the trade the rate is from £2 10s to £3 per week of ten hours per day.

Mining on Private Property in Australia.—The Mining on Private Property Bill which has passed the Victoria Assembly by a large majority, was referred by the Council to a select committee, whose report recommends that mining on private propcrty should, under certain conditions, even without the consent of the owner, bs authorized by law; that auy party of miners holding minere' rights, and desirons of working a claim situated upon private property, should be empowered to move the Minister of Mines to resnme occupation of the land for miuing purposee; that the owner of the land applied for ahonld, for three months after the application, have the option of undertaking to mine it himself, and that, after a valuation of the aurface had been made, the owner should have power to demand payment at the rate of double the valuation. The motion to adopt the report was negatived, after a brief debate, without a divieion. The people of the mining districts have been much irritated by this.

K. K. Mine Improvements.

Ths faith of the K. K. Co. in the permanency of Ruby Hill mines has besn practically exsmplified by the procnring of supsrior hoisting machinery and the ersction of a grand looking building over the main shaft. The hoisting works are probably the most complete in this part of the State, and are alike creditable to the enterprise of the company; the jndgment of Professor Keyes, as a miuing snperintendent; the ability of A. A. Thompson, the engineer and machinist, who furuished the plane and supervised the setting of the boiler and engine; and the skill of the makers, Booth & Co., of San Francisco. The boiler is 16 feet by 54 inches, has 38 4-inch tubes, a steam drum 7 feet by 26 inchee, and a mud drum 8 feet by 14 inches. Between the boiler and engine is a Knowles donkey feed pipe, which can be used, if required, as a fire engine. The engine, which is horizontal, is of massive yet finely adjusted proportions; it is of 50-horse power and of link motiou, the cylinder being 12 by 24 inches. The hoist has 8 feet spur gear, geared three to one, and the lowering can be done either by the break or engine. The shaft is provided with eccentric safety cages, worked by a 4½-inch flat wire rope three-eighths of an inch thick. Both boiler and engine have been firmly set in dressed stone, and appearances even have not been overlooked—every part of the machinery admitting of it having been tastefully painted in appropriate colors. The building inclosing the works is a substantial frame, with trussed roof; and by introducing an arched light in the front gable, and properly arranging the other windows, it looks imposing and attractive —very different from the dilapidated, barn-like structures usually employed for hoisting purposes. This portion of the improvement has had the especial care of Thomas Conn, the foreman, who, while attending to the mining and timbering work so effectively that such a thing as an accident is scarcely known under his charge, has the correct idea that the outside view around a mine indicates in some measnre the nature of its management. Long may the K. K., under its ahle managers, continne to yield abundantly.—*Eureka Sentinel.*

Government Buildings on the Pacific Slope.

The assay office at Boise City, Idaho, is constructed of a sandstone found in the vicinity of that city. It was begun in the year 1870, and finished in 1872, at a cost of $68,591. In its appointments and appurtenances it is said to be one of the best assay offices, though not the most important, owned by the Government.

The Branch Mint at Denver City was begnn in 1862, and was finished in 1864, costing $93,377.

The pnblic building at Portland, Oregon, is an elegant building of blue freestone; is two stories and an attic in hight, and is a classio design, consisting of pilastrade carried on rusticated piers, with segmental arches in the basement story. It is uow nearly completed, and will be the finest building in the State of Oregon, and one of the finest on the Pacific Coast. Cost, $114,324.

The Custom Honse, Astoria, Oregon, jnst finished, is a fine building of rubble stone, quarried near the site, and is 60 feet by 45 feet, and two stories in hight. It hae cost about $75,000.

The Branch Mint at Dalles City, Oregon, wss begun in February, 1869. After an outlay of $103,280, work was abandoned.

The Branch Mint at Carson City, Nevada, was begun in June, 1866, and finished in 1870. It is of rubble stone, with hammered dressings, and cost $196,187.61.

Sargeant's New Land Bill.—Senator Sargeant will introdnce in the Senate a bill relating to the public lands of California, the provisions of which will be as follows: That the public lands in the State of California shall not be excluded as mineral from preemption or homestead unless it shall be shown that *bona fide* mining claims exist thereon, and the price both of agricultnral and mineral lands outside of the limits of railroad grants, shsll be one dollar and twenty-five cents per acre, and that where two or more settlers have improvements in the same legal subdivision, whether agricultural or miuing, or both, it shall be lawful for such settlers to make a joint entry of their lande at the local land offioe on application for such land, and they may prove up and pay for snch land in the same manner and to the same effect as is provided by the law of agricultnral settlere, upon the same legal subdivision; provided, that the proof of occupation and improvement, nnder the mining rules, of the portion of said land claimed as mining claim, may be given in said proceeding hy the applicant, as now provided by law. Notice of the eaid application, when the patent of miuing claim ia sought, shall be given, and have the same effect as now provided. In caaes of applications for mining claims, all affidavits and proofs reqnired by law are to be made before the local land officers. Mining and prsemption cases may be taken before any officer authorized to administer oaths, and when filed with the Register and Recorder, they shall have the same effect as if taken before those officers. Effect shall be given to this Act by regulations to be prescribed by the Commisioner and Attorney-General in office.

California Quicksilver Mines.

The second payment of the purchase of the Missouri mine was made in this city on the 28th ult. The new proprietors have a nomber of maseus and miners at work; the former putting op two lsrge D retorts capable of rcducing one and one-half tons of ore a day. They have a fine engine for crushing the ore, and expect to be producing quickeilver by the 10th inst.

The miners at work in the new shaft of the Yellow Jacket came upon a fine ledge of cinnabar some two feet in width on Monday last. The ore runs from 1 to 10 per cent., and the ledge is well defined and the cinnabar well diffused throogh it. The whole force of the mine will he at once employed to ascertain its extent preparatory to fornaces being erected.

The owners of the Rattlesnake mine, so famous for its rich deposit of native quicksilver, are running a large tunnel into the hill, intending to strike their ledge directly underneath their present magnificent showing.

The fornsce at the Thompson or Sonoma mine, being completed under the supervision of Mr. Lookhardt, fires were introduced therein for the purpose of thoroughly drying it before putting in the ore. The condonsers are being attached to the fornsce, and by next week they will be charged with the ore stored in large qoantities beside the fornace.

The mine is owned by General Dodgs and others, of San Francisco, who have expended during the past ninety days over twenty thousand dollars in improvements and redocing worke. The road is now opened directly to the mine. Some thirty men are employed making adobes to burn in the fornaces and in getting oot ore for the same.

Work haa been commenced in earnest on the Mohawk mine, located near the Rattlesnake, by Messrs. Virgin & Co., who have bonded the mine for a large amount.

There are a large number of mines in our vicinity showing good metal, and spring will cause many of them to be fully doveloped. Capital is moch needed to operate them. Reducing works are so costly that few of the present owners can afford to errect fornaces at present. The Knox fornsce and the Lockhardt and Riotte furnaces are the favorites, bot as they are both very costly, the prospectors are very slow in extracting the quicksilver from the rich piles of ore which many of them exhibit. A good custom furnace, of ten tons capacity, in the vicinity of Geyser Peak, in the center of the mines, would, we think. prove a snccesefol specolation.

Several thoosand empty qoicksilver flasks have been forwarded to the Great Western for winter nse. The mine is producing from fifty to eixty flasks of quickeilver a week, is well managed, its fornaces workiog well, and has the reputation of heing one of the best paying mines in thie section.

When the new road from the Redington mine to Calistoga is completed, and the proceeds from the mine, together with those of the Great Western, Phœnix, Geyser, Missoori and Sonoma psse through oor city, we shall be quite a oinnabar center, and it will sdd greatly to the business prospects of Calistoga, for the supplies for this immense oinnibar district will necessarily pass over the same road.—*Calistoga Tribune.*

Ophir Oistrict Mines.

In a letter to the Salt Lake *Herald*, a correspondent of that joornal saye:

Ophir is the best poor man's camp in Utah, and it always has been so. No camp is so rich in fair milling ores that poor men can take out and sell for cash, realizing enough therefrom to live and carry on their work. Again, the number of mines now discovered in this camp sum up into the hundreds, among which are a list of first-class mines, snch as the Tiger, Chief, Lion, Snnnyside, Monarch, Miners' Delight, Chicago, Hidden Treasure and Mono, that rank with the Emms, Flagstaff and Daveuport. Of all soch mines in this camp I have nothing further to say than that they are "slashing" good mines. It is of the seoond and third rate mines that I always have most to say. The valuable prospects of the camp are what I feel the most interest in, and of these there are hundreds that await the hand of indostry to develop them. Aod here it is where Ophir offers the greatest indncements. If the hundreds of men who have small capital in cash and plenty of energy and determination will come here and take bonds on mines to develop on shares or for interests in the claims, they conld make comfortable fortunes in a few years. No place offers such favorsble inducements, or so many of them as Ophir district.

All over the hills, in every direction, are valuable prospects, the owners of which have too many of such claims, or not enongh of energy and industry to develop them and make them prodncing mines. Let the men who hang aronnd the city with small capitals come out here and invest it in the development of mines and they will he eure to do well, if they act judiciouely, and perhaps they can strike it rich and become independent. It is in this way that the present Mono owners became millionaires, and there are plenty more Monos in Ophir waiting the results of development to tnrn their millions of wealth into the coffere of enterprising men who diligently seek these "treasure hoxes."

Cremation.—An eccentric will, wherein the testator reqnested that his body might be consumed in a gas-retort, and thus msde to contrihote to the enlightenment instead of the poieoning of the world, has revived the long-forgotted sobject of cremation. Without doubt Mr. Trelawney's hideously graphic description of the horning of the body of Shelley has greatly contrib oted to prejudice the public mind against the clesnest and best method of getting rid of the "mortal coil." But the ceremony at Spezzia was conducted in the most bungling fashion, and a want of scientific appliances contriboted to the incompletcness and, therefore, to the horror of a simple operation. A retort gets rid of the entire difficulty, and both from a ntilitarian, a scientific, a sanitary, and a poetic point of view, the mansoleum, decked with cinerary urns, poseesses immense advantages over the damp and unwholeeome graveyard, exhaling pestiferons odors, to which modern nations—for some inscrutable reason—are preposteroosly wedded.—*Iron.*

A New Substitute for Rubber.—A Canadian has devised a method of producing gum from the milkweed plant, or other plants of the aeclepia family, and flax and other seeds, which conciete in macerating and fermenting the sobstances, and then, hy evaporation, redocing the resolting liquor to a thick, gummy mass. The gom thos obtained may be cheaply produced, and is alleged to havo many of the valuable qoalitiee of rob ber. It is insoloble in water, may be vulcanized with solphor, etc.

Heavy Yield.—The assay of tho fine specimen found a few days ago in the seventh level of the Raymond & Ely's main shaft, showed $2,317.03.—*Record.*

DEWEY & CO.,

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important bosiness with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an ahle, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent bosiness men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the infinence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "Dewey & Co., Mining and Scientific Press Office, San Francisco." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send $15 currency, amonnt of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the docnments made up, and soon sent to the inventor for signing.

As soon as signed and returned to ns with the fees then due us, it will be sent straightway to the Patent Office at Washngton.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, snfficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illnstrated circular, containing a digest of Patent Laws, 112 illustrated mechanical movements, and Hints and Instructions regarding the rights and privileges of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., Mining and Scientific Press Office, S. F.

BY CUIDO KUSTEL,
Mining Engineer and Metallurgist.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illnstrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illnstrations of fnrnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenirets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general nse, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M. D.; 1867; cloth bound, 114 pages. Printed and sold by Dewey & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by Dewey & Co., Mining and Scientific Press Office, S. F.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Dec. 16th, 1873.

FOR WEEK ENDING Dec. 2d, 1873.*

EGG CARRIER.—Frank M. Wade, S. F., Cal.

HORSE SHOE.—Robert K. Jordan, Oakland, Cal.

GATE.—Elijah Hickman, Red Bluff, Cal.

TOY PUTTY-BLOWER.—Nathan Joseph, S. F., Cal.

LUBRICATING DEVICE FOR CAR AXLES.—William J. L. Moulton, assignor to Jeinsen Lubricator Compauy.

CAR AXLE BOX.—William J. L. Monlton, assignor to Jeinsen Luhricator Company.

SOLDERING TOOLS. — Lewis Cutting, S. F., Cal.

PROCESS OF SEPARATING SILVER FROM OTHER METALS.—Conrad Wiegand, Virginia City, Nevada.

———*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

GIANT POWDER GASES.—When Giant Powder was first introduced in our mines, the men found great fault with it, and insisted that the fumes injured their health. Their prejudices have in a great measure been overcome and the powder has come into universal favor as an explosive. In this connection we repnhlish an item which, we think, was taken from *Appleton's Magazine*, but probably first appeared in an English paper. It seems that in order to determine, if possible, the relative injnrious properties of the gases resulting from the explosiou of gun powder and dynamite, (Giant Powder,) Lord Roharts, the founder of the Miners' Convalesceut Hospital, determined to test the question. Accompanied by a competent chemist, this practical philanthropist descended iuto the mines and, side hy side with the miners, inhaled the ohnoxious gases, marking carefully the effects upon the nervous and respiratory organs. While the actual results were heing reduced and accnrately recorded, the chemist was engaged in collecting samples of the gases for subseqnent analysis. The explosive compounds were dynamite, (Giant Powder,) gun-cotton and gunpowder, and the results were in favor of the dynamite.

KIND WORDS.

The Associated Reformed Presbyterian says—For years Perry Davis' Pain-Killer hss been known as s most useful family medicine. For pains and aches we know nothing so good as the Pain-Killer. For many internal diseases it is equally good. We speak from experience, and testify to what we know. No family ought to he without a bottle of Davis' Pain-Killer.

MESSRS. PERRY DAVIS & SON, PROV., R. I.—

Gents:—Although a stranger to you I am not to your invaluable medicine, Pain-Killer. I formed its acquaintance in 1847, and I am on most intimate terms with it still; my experience in its use confirms my helef that there is no medicine equal to Pain-Killer for the quick and sure cure of Summer Complaints, Sore Throet, Croup, Bruises and Cuts. I have used it in all and found a speedy cure in every cese.

Yonrs Truly, T. J. GARDINER, M. D

Judging hy our own experience whoever once makes a trial of Perry Davis' Pain-Killer, will not fall to recommend it widely as an nnequalled liniment, ead valuahle internal remedy for colds and various other complaints.—*Every Month.*

The efficacy of Perry Davis' world-renowned *Pain-Killer* in all diseases of the howols, even in that terrible scourge, the Asiatic cholers, has been amply attested by the most conviacing authority. Missionaries in Chine and India have writted home in commendation of this remedy in terms that should carry conviction to the most skeptical, while its popularity in communities nearer home is ample proof that the virtues claimed for it are real and tangible. Among family medicines it stands unrivaled.—*Boston Courier.*

The *Saturday Even'g Gazette* of Boston, says:

It is impossible to find a place on this broad land where Perry Davis' PAIN-KILLER is not known es a most valnable remedy for physical pain. In the country, miles from physician or apothecary, the Pain-Killer is cherished as the exclnsive panacea, and it never decelves.

"PERRY DAVIS' PAIN-KILLER is reelly a valuable medicament, and, unlike most of the articles of the day, is used hy many physicians. It is particularly desirable in locations where physiclans are not near; and, hy keeping it at hand, families will often save the necessity of sending out at midnight for a doctor. A bottle should be kept in every house."—*Boston Traveller.*

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office, San Francisco:

PACIFIC COMMERCIAL CO.—Dec 13. Objsct: To do a generel mercentile business, together with wharfing, docking and all kinds of trado and commsrce; ths procuring of land on the Navigator and surrounding islands in the South Pecific, by purchase or otherwise, with power to improve, lease and sell, or otherwiss to dispose of the sams. Trustees—Frederick Cley, J. W. Stow, Adolph Weske, David Ferquharson and Wm. T. Bradbury. Capitsl stock, $150,000, in shares of $100 each.

ANTILLES M. Co.—Dec. 16. Location: Ely Mining District, Nevada. Directors: C. D. Cushman, H. G. Williams, J. B. Cooper, E. Skerrstt and John Turner. Capitel stock, $3,000,000, in shares of $100 each.

LADY BRYAN M. Co.—Dec. 15. Location: Flowery Mining District, Storsy County, Nevada. Directors: Solomon Heydsnfeldt, A. P. Minsar, Geo. D. Roberts, J. W. Pearson and Edward Kanelly. Capital stock, $5,000,000, in shares of $100 eech.

CONSOLIDATED WASHOE M. Co. Dec. 16. Locetion: Gold Hill Mining District, Nevada. Directors: Mertin White, Hill Bsachy, M. P. Maddsn, P. J. Kennedy and Jecob Smith. Capital stock, $4,000,000, in shares of $100 eech.

SAW-PIT FLAT G. M. Co.—Dec. 16. Location: Plumas Conuty, Cal. Directors: Wm. H. Sharp, John Sroufe, J. P. Slawson, E. P. Pond, J. W. Clerk. Capital stock, $100,000, in shares of $100 cach.

GOPHER HILL CONSOLIDATED M. AND DITCH CO.—Dec. 17: Locetion: Mineral Township, Plumas County, Cal. Directors: G. E. Binckley, William H. McCarty, O. W. Hane, P. H. Flinn and William Small. Capitel stock, $1,000,000.

ANDES S. M. Co.—Dec. 17. Location: Storey County, Nevade. Directors: Edward Barron, George S. Dodge, John Landers, Robert F. Bunksr and Geo. W. Brittan. Capital stock, $5,000,000.

THERESA M. AND M. Co.—Dec. 17. Location: Mariposa County, Cal. Directors: M. Gately, J. W. Tripp, J. B. Heporte, J. W. Malen aud D. W. Taylor. Capitel stock, $1,500,000.

Meetings and Elections.

GOLD CANON CONSOLIDATED M. Co.—Dec. 11. Trustees: Wm. B. Thornhurg, Jeroms Lincoln, Robert F. Morrow, A. B. Perkins and Geo. Pardow.

COMET CONSOLIDATED M. AND M. CO.—Dec. 12. Trustees: J. D. Conghlin, W. G. Wayman, C. M. Bates, D. M. Hosmer and E. P. Hubberd. After which, Deniel M. Hosmer was elected President; C. M. Betes, Vice-President; W. G. Wayman, Treasurer; W. Aug. Knepp, Secretary.

PENINSULAR M. Co.—Dec. 16. Trustees: W. D. Fordhem, J. M. Billings, Robert Walmsley, B. P. Clement, Giles H. Gray, D. A. Jennings, M. V. Brown.

WHITE MOUNTAIN M. Co.—Locatiou: Amedor County, Cal. Trustees: President, C. M. Pillsbury; Vice-President, Isedor Charles; Treesurer, Daniel M. Hosmer. W. Aug. Knapp was appoiated as Secretary.

HOPE CONSOLIDATED M. Co.—Trustees: W. R. Wheaton (President), Geo. W. Beaver (Vice-President), J. S. Paxson (Secretary), A. G. Abell and J. D. Fry.

LEWISTON S. M. Co.—Dec. 13. Trustees: G. W. Fisher (President), W. J. Collins, Charles C. Harvey, Henry O. Howard and William Stuart (Secretary).

OPHIR M. Co.—Dec. 17. Trustees: B. Pearl, A. H. Lissak, Jr., F. Cean, F. A. Hassey, E. M. Hall, E. J. Baldwin, M. H. Greyson. Subsequeutly A. H. Lissak, Jr., wes chosen President; Jas. Marks, Secretary; J. C. Corey, Superintsudent. Cash on hand Decsmber 17, 1873, $47,459.

COLONADO G. M. Co.—Dec. 17. Trustees: Julins Trench, E. L. Willard, R. K. Mcrriner, G. A. Treadwell and W. P. Treadwell.

EMPIRE M. AND M. Co.—Dec. 17: Trustees: E. J. Baldwin, J. W. Colemen, A. Goldsmith, Camilo Mertiu and Robert Sheldon.

The Mining & Scientific Press

Started in 1860, is one of the oldest weekly journels now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly enlerged and constantly improved. The active and steadfast efforts of its pnblishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Every Miner, Assayer, Millman, and Mctallurgist in the United States should take it.

Every Pacific Coast Mechanic, Engineer, Inventor, Manufacturer, Professional Man, and Progressive and Industrial Student should patronize its columns' of fresh and valuable information.

Every Mining Engineer, Superintendent, Metallurgist, Mine Owner and Mine Worker in the world should profit hy its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Every intelligent thinker in the land, in high or humble situation, who would avoid literery trash for genuine information, should SUBSCRIBE AT ONCE.

Machinery.

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

For further particulars apply to

R. HOSKIN, Dutch Flat,
R. R. & J. CRAIG, 304 Montgomery st., S. F.
Or WILLIAMSON & CORY, Marysville.

☞ Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in Grains Grammes, will be sent free upon application.

7v25-tf JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Oprates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ores is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

Nevada Metallurgical Works,

21 Firet etreet.....San Francisco.

AXLE GREASE.

To Miners, Millmen and Others.

Your attention is called to the very superior AXLE GREASE manufactured by us for over 18 years.

Recent improvements in the chemical arrangement of the inbricants used in its manufactnre render its use as serviceable on the lightest buggy as on the heaviest team.

The extensive demand for the H. & L. Axle Grease has enabled the proprietors to reduce its price to as low a rate as any of the inferior compounds, which are continually being forced upon the market.

See that the trade-mark (H. & L.) is on the red cover of the package, and take no other.

DEWEY & CO'S SCIENTIFIC PRESS Patent Agency.

SCIENTIFIC PRESS—Mining and Mechanical. PACIFIC RURAL PRESS—Agricultural.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages aa a Homs Agency over sll others by reasons of long establishment, great experience, thorough system, and intimate scquaintance with the subjecta of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent ousiness, and obtain Patents in *all civilized countries*. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice aa to the patentability of new inventions. ADVICE AND CIRCULARS FREE.

SHAREHOLDERS,

TRUSTEES, and

SECRETARIES of

ALL MINING COMPANIES,

Should see to it that their Notices are advertised legally in the **MINING AND SCIENTIFIC PRESS**, at much less cost than the usual ratea of daily publications. Evsry person interested in the prosperity of legitimate mining enterprises should favor such practical sconomy. Send for circular of convenisnt dates for sdvertising, fres blanks, and a copy of ths New Code Corporstion Assessment Lsw.

Laws Concerning Corporations.

[Under the New Code—January 1, 1873.]

GENERAL PROVISIONS APPLICABLE TO ALL CORPORATIONS.
WAGON ROAD CORPORATIONS.
WATER AND CANAL CORPORATIONS.
HOMESTEAD CORPORATIONS.
MINING CORPORATIONS.
LAND AND BUILDING CORPORATIONS,
ALSO, MINING PARTNERSHIP LAW.

A pamphlet containing the abovs provisions concerning Corporations has been printed from the Statutes of California. It furnishes those who wish these special laws an opportunity of obtaining them for the small sum of 25 cents (post paid). Address, DEWEY & Co., Publishers, and Patent Agents, S. F.

Improve Your Poultry.

It Costs No More to Keep Good Fowls than Poor Ones!

SEND STAMP FOR ILLUSTRATED CIRCULAR

Containing a full description of all the best known and most profitable Fowls in ths country to

GEO. B. BAYLEY,

Importer and Breeder of Blooded Fowls, and agent for the POULTRY WORLD, a monthly magazine devoted entirely to Poultry—tells how to keep Fowls for pleasure and PROFIT. Subscription only $1.25 per year. Address

GEO. B. BAYLEY, Box 659, San Francisco.

HALLIDIE'S

Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

Ths system of tranaporting material, such as Orea, from the mine to the mill, Eartha for embankmenta, Rock from quarrica, etc., by means of steel wire rope, has been well tested and found **more economical, advantageous and reliable** than any other method of transportation; and to the annexed certificates in connection therswith I beg to call the attention of thoss interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by yon upon our mine in Freiburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can jndge, there is nothing about it to ever get out of order—nothing to wear ont. While ours requires but about two thousand five hundred feet of wirs rope, I can see no reason why this line could not be extended almoat indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial npon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, nse it in any way you think proper. Vsry respectfully, O. O. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO., Little Cottonwood, Utah, Superintendent's Office, Sept. 28, 1872.

T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevatcd wire tramway, which carries its load of ore as quietly and easily as if there was no winter or anow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the snrface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 20, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,
113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of sll kinds and descriptions, furnished at lowest ratss. A. S. HALLIDIE 113 and 115 Pine St.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, DECEMBER 27, 1873.

VOLUME XXVII Number 26.

Palmer's Power Spring Hammer.

Our illustration presents a view of Palmer's power spring hammer, an invention, it is claimed, which has the advantage of being operated by the same power as is used to run the works in which it is used, and without the additional expense of extra boilers and attendants. The machine, it is stated, can be governed by the foot of the forger so perfectly as to cause it to crack a walnut or to strike a blow equal to a steam hammer of the same grade. The smallest size will deliver 500 strokes a minute, and is especially adapted to forging cutlery of all descriptions, bowls of spoons, small hardware, jewelry, etc. The medium size is designed for the use of a general forge shop, and will strike 250 a minute. The largest forms strike 100 blows per minute; it is believed, are as well adapted to all classes of work as the steam hammer, while they are free from the expense attending the use of the latter.

In the engraving is shown a side view of the machine. The dies are made in the usual manner, and are keyed in position. The machine is driven by a friction pulley sliding on a splint in the shaft, the belted pulley being loose on the latter. The friction pulley is operated by a forked clutch worked by the angled levers attached to the long foot lever, which is bent around the fore part of the hammer so as to be accessible on both sides and front of apparatus. The shaft has a crank forged in the center and carries upon it a connection which extends to a leaved spring. On the other end of the spring is attached the hammer head, in which is keyed the top die. The spring works upon the bearings of a flat rocker shaft to which it is securely bolted.

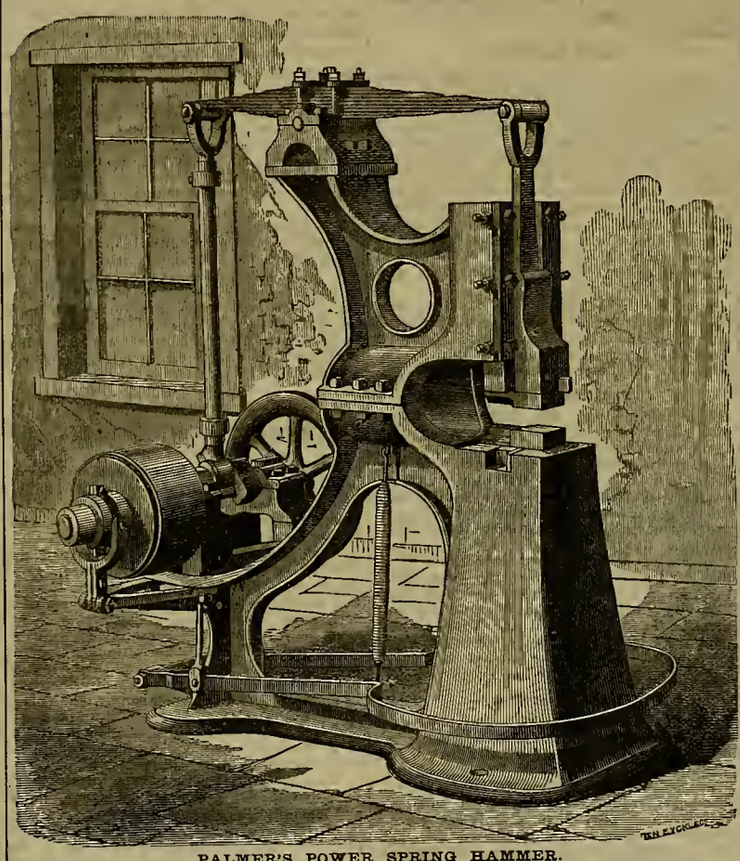
The operations are as follows: The iron being heated and placed upon the die, the forger places his foot on the treadle to depress it, thus drawing down the arm that moves the clutch-friction into the running loose pulley. The crank is thus revolved, drawing down the spring which carries up the hammer head, and producing by its velocity a vibration of the spring in which the blow is given in proportion to the velocity with which the crank revolves. It is aptly illustrated by cracking a whip. To forge a long rod or scythe, an aperture cast through the body of the upright part so as to allow the work to be passed lengthwise the forging dies is provided. The slightest pressure of the foot on the treadle is easily observable in the working of the machine, but the head never allows the dies to meet until there is velocity enough to produce requisite vibration of the spring. The balance-wheel, on the end of the crank-shaft, acts in two capacities, the wheel having a balance placed within its rim to counteract the weight of the hammer-head, thus allowing the hammer to stay in any position in which the friction may leave it, thereby preventing the weight of the hammer-head from always resting on the lower die when stopped; and the momentum of the wheel keeps the machine perfectly steady when running, and prevents, by the balance within its rim, that oscillating movement of frame which would be the result of the blow, if not thus balanced.

It is simply impossible for a person who has never seen one of these hammers in practical operation to form any adequate idea of the rapidity and force with which the blow is given and the ease with which is controlled. The hammer illustrated herewith is a No. 3, designed especially for general job work, and will forge from "2 square cast steel down to 1-8" with equal facility.

The ram of No. 3 size weighs 60 lbs., the total weight of the hammer being 2,000 lbs., while it only occupies a space of three feet by five, or about one-third the room required for a regular trip hammer.

These hammers have all the advantages of the steam hammer, while they are still easier to manipulate, and require neither costly boilers nor extra attendance to operate them, being driven direct from the main line of shafting, or from a counter shaft, as desired. This hammer was awarded the first premium, of a silver medal, over all competitors at the last American Institute Fair, where only a second hand machine was exhibited.

These hammers are now in use in many places, doing all classes of forging, from the smallest forks upward, while there is no work performed by either trip or steam hammers which cannot be done on these with equal facility, and as far as dollars and cents are concerned, at a less cost. The hammer is the invention of Joseph Palmer, but is manufactured by S. C. Forssith & Co., Manchester, N. H., who may be addressed for further information.



PALMER'S POWER SPRING HAMMER.

THE TRENCH MILL, at Silver City, now crushing ore from the Consolidated Virginia mine, is one of largest and finest in that section. It is connected with the Virginia and Truckee railroad by a branch track, so that the ore can be transported by rail direct to the mill.

THE Idaho mine paid out this year $2,941 for quicksilver.

California Gravel Mines.

We are rejoiced to know that as the year draws to a close, more and more interest is manifested in California gravel mining property. Every week we hear of transactions in this class of mines and the increased confidence in them as paying properties. The vast extent of territory covered by the auriferous gravel in this State can hardly be realized by one who has not been in the regions where it occurs. Even those who are familiar with our placer districts would be surprised on seeing the proportion of our large State which is covered by these deposits as shown by the "Map of the Pliocene Rivers" of the State Geological Survey. This map would be of more practical value, perhaps, to our mining men, than anything yet brought forth by the Geological Survey, but it has not yet been completed. We saw a rough draft of the map about a year and a half ago, but no one except the head of the survey can explain why it has not yet appeared, and we will probably have to wait his pleasure for an explanation, unless our indefatigable Governor stirs it up.

While the world at large, and in fact many of our own residents, have an idea that our placers are exhausted, because our annual gold product has fallen from $90,000,000 in 1852 to $15,000,000, far from being exhausted, we are just commencing to realize their value and extent, and beginning to work them systematically. In the "days of '49" shallow placers were worked, requiring only labor with pick and shovel and pan and rocker, and immense amounts of gold were extracted or rather picked up in this crude way. Naturally, a few years served to exhaust this class of mines and attention had to be turned to the deeper and more lasting "deep deposits." These require immense outlays of capital and labor, but give a *sure* return. They are more certain than quartz mines and can be counted on as permanent to bed rock. There is much less of a speculative character in gravel mining than there is in delving in the quartz, a fact which our English cousins are rapidly beginning to appreciate.

We notice that a sale is contemplated to European capitalists of the extensive ditch property and mines of the Eureka Lake and Yuba Canal company of Nevada county. It was only a few weeks since we noted the fact of the Blue Tent Hydraulic claims having been put upon the English market. The El Dorado Water and Deep Gravel company in El Dorado county, was organized sometime since to introduce water into the surrounding district, which aggregates some 200,000 acres of auriferous gravel. The company have purchased all the property rights of the old South Fork Canal Co., and also those of the Gold Hill, Iowa and Weber Ditch Co., aggregating some 144 miles of ditches and flumes, the construction of which formerly cost from $800,000 to $1,000,000. Embraced in these water rights, the *Alta* says, there are some 18 or 20 lakes at the summit of the Sierras and which feed the various tributaries of the South Fork of the American river, from which this company propose to take their water, at an elevation of about 4,000 feet. These lakes and tributaries have a water shed of about 280 square miles, and as the former are some ten square miles in area, they constitute a perennial source of an abundant supply. Their storage capacity, however, can be greatly increased by the construction of dams, upon which considerable work has already been done.

With these means and artificial reservoirs this company will commence in the spring the largest canal for mining purposes, ever made in California, if elsewhere. Where the miners have heretofore paid 25 cents per inch for water the company propose to charge only 10 cents per inch. Enterprises of this sort are of national importance as well as of local interest, since all these ditches open up new mining country, build up new districts, give employment to numbers of men and aid in swelling the bullion product of the world.

THE LIFE OF PATENTS.—All United States letters patent, granted since 1861, are for 17 years, and by act of Congress cannot be extended. Patents previous to the above date were granted for 14 years, with the possibility of being extended for seven years, in all 21 years. All patents issued before 1859, which have not been already extended, are dead. Consequently only those issued since 1859 can be extended. After 1875 none will be subject to extension. We find by experience that many patented inventions which are incomplete in themselves are found to be stumbling-blocks in the way of later inventors. The first invention often "sleeps" in the patent office until a more ingenious or active man perfects a device for similar purposes to find that his really valuable invention is subject to the patent granted to the worthless one. For this reason we think that all patents not worked for several years should become null and void.

AN Ingersoll Rock Drill is to be put at work on the Sanderson mine, Railroad Flat District, Calaveras county.

CORRESPONDENCE.

The Origin of Veins and Formation of Mineral Lodes.

In the pressnt paper it is not proposed to bring forward any new theory of the origin of mineral deposits, nor to advance much that is new to the ecientific miner, but only to restate already well-known facts, and create a sympathy with scientific modes of thonght and examination as applied to mining and the discovery and exploration of mineral bodies. In the present article I shall deal only with the origin and formatiou of

Fissure Veins.

Whether we regard metals as perpetually existing in the matter forming the globe, or as the resnlt of psendomorphic changes in the evolution of higher forms of matter, we are etill impressed, npon examining a deposit of ore, with the facts that the ore iteelf conld not be the oause of the fissure in which it ie contained, and that from whatever sonrce the ore may have issued, the filling of the vein was a subsequent and very different operation from the formation of the fissnre.

How, then, were the fissures formed? There are various ways in which the earth's crust might be rent—by volcanic action, by the snbsidence of a part of the earth'e surface, by the npheaval of a part of the surface; but the most probable cause would appear to have been the one first mentioned, as many instances of recent occurrence go to show that fissures similar to vein-fissures are frequently formed In 1848 an earthquake occurred in New Zealand, which opened a fissure through a chain of mountains from 1,000 to 4,000 feet high. The fissure appeared to be of great depth, extending nearly sixty miles, bnt not exceeding eighteen inches in average width. Similar fissnres were opened in the great Central American earthquake of the preeent year, and also in Inyo county, California, two yeare ago. In fact, eo well is this fissnre phenomena of earthqnakes nnderstood that Mallet was able to locate the central area of the Neapolitan earthquake of 1857, aud estimated the fissure, the forming of which caused the first shock, to have been seven and a-half miles in length, by five and three-fourth miles in depth. So far as fissnres are formed by a single shock they run parallel to each other, though when more than one shock occnrs they may form in gronps and, as we often find, vein-fissures radiating in every direction.

The characteristics of a trne vein are that it runs through the country rock independently of its stratification and that in either or both its dip and strike, it is not influenced by the dip and strike of the formations in which it is enclosed. Trne veins may be fonnd in almost any formation, and may cross two or more formations, as the same vein may be found in granite, slate, sandstone, and lime, though such continuatione of one vein are very rare, still it is not uncommon to find a vein cutting two formations, though the vein matter may be dissimilar in both, still the vein remains one and the same. This vein nature is not influenced by the commercial value of its contents, as the Comstock of Nevada is no more a trne vein than the Atlantic or Wyoming, thongh one is worth millions, while the other is, so far, worthless.

One per cent. of silver makes a valuable ore, bnt five per cent. of iron wonld be considered worthless.

The question now arises, how was the fissure filled. This is not always readily answered. The theory which holds good in one instance may be utterly at fault in another. Thne in the copper mines of Lake Superior, the metal is so closely associated with dikee of undoubted igneous origin that injections of the metals and enclosing trap at the eame operation at once suggests itself; the same phase of vein formation occurs in Little Cottonwood cañon Utah. Where the trap dikes contain copper, lead and silver, in at least two instances, while the silver mines in the immediate vicinity are of nndoubted aqneous origin; so are the gold and silver mines of Colorado, so are the mines of the other Western States and Territories. The evidences of aqneoue formation are: the crystalline structnre of the gangue and metals; the vertical clearage of the gangue the presence of cavitiee filled with crystals, or with metalic or other crystals attached to the walls of snch cavities; the crystalline structnre of the ore itself, as in galena and other sulphurets. The filling of the vein by aqneous solution may have extended over a vast period of time indeed, in most instances, such would appear to have been the case.

The mode of such filling might have varied under different conditions, but in nearly every instance

The Theory of Infiltration,

Is the one which appears to most nearly eupply all neceesary conditions. This theory suppoee veine to be formed in already existing fisures by infiltration of water from the surrounding wall rock at great depth, either in the form of vapor or as an aqueous eolution, and bearing the metals in solution to be deposited in the vein. This theory embraces that of snhlimation, as if during the period of metamorphic change the lower sedimentary rocks were, so to say, swsated by heat and steam till nearly all their metals were extracted and they themselves transformed into the ssmi-marbles and qnartzites which we now find. The metals must have besn deposited somewhere and as it is in just snch rocks we find the majority of mineral veins, the conclusion seems almost irresistible that this was the sonrce of at least a large proportion of the ore deposits now in existence. Where veins occnr in the igneous rocks, the sams process again ensues with only this difference, that the probable sonrce of the metals is from vapors arising from the hearth of the igueous rocks below, as those rocks are too hard to be extensively acted npon by water alone. Thus we have in thie great labaratory of natnre a continual change constantly progressing towards more perfect forms of all matter, and when the placer miner picks up hie pan of golden sand he only saves by water that which water once deposited as a gold solution is deposited in the laboratory of the chemist, any organic substance almost being able to attract and precipitate the precious metal. Those vein fissures flowing little rivulets down the sides of the western mountaine, gave us the wonderful wealth of California, in early daye, while the veins themselves will yield a richer harvest to future generations.

J. H. MORTON.

San Diego Mines.

EDITORS PRESS:—It is so seldom that any news from this magnificent mining section appears in your valuable paper, and believing that you are anxions to publish any reliable information concerning tbe mining interests of this coast, I have taken the responsihilty of commnnicating a few lines.

The mining interests of Julian and vicinity, although second to no other mining dietrict in this State, have been laboring under a great many difficultics. In the first place, we have had to contend with one of California's special curses, a

Spanish Land Grant.

The so-called Cnyamnca Grant was floated over this mining district about three and one-half years ago, since which time the miners and settlers have beeu fighting the eame. A decision in the case has finally been rendered by the U. S. Land Commissioner at Washington City, D. C., and in favor of the miners and settlers. The news reached here on the second of the present month; as eoon as the people here were made acquainted with the news they became almost wild with excitement; one of the owners in the so-called grant was hung end hnrned in effigy. This worthy bears the cognomen of John Treat.

Since the cloud that has been hanging over us so long has passed away without doing us any other than temporary injury, I will endeavor to give you a synopsis of our miuing interests. This section ie composed of

Two Mining Districts,

Julian and Banner. The belt of auriferous quartz is about eight miles in length, running nearly northwest and eontheast. There are scarcely five hundred feet of gronnd on this entire belt where gold has not been fonnd in paying quantitiee. The most prominent among the many minee that have been worked up to the present time, are the Chariot Mill and Mining Co., Ready Relief, Stonewall Jackson, Owens, Helvetia, Mammoth Tunnel and Mining Co., Tom Scott, Pride of the West, Kentuck, Madden, Chapparal, Antelope and Hayden. Three of the ahove are incorporated companies. The Chariot Mill and Mining Compauy has lately been incorporated in San Francisco, and the Owens and Mammoth Tunnel have heen incorporated in San Diego.

The Chariot Mine

Ie one of the most promising mines that I have ever seen on this coast, so far as the mine has been developed. The main shaft is down ahout one hnndred and forty feet. The main shaft is connected hy an air shaft to the 140-foot level. The lode ie from three to fifteen feet wide, the rock of which pays from eeventy-five to two hnndred and fifty dollars per ton in free gold. The company have a five-stamp mill which is located about fonr miles distant from the mine. For several months this mine has yielded on an average of one thousand dollars per day, uet profit to the owners, of whom there were hut three—Messrs. Coyne, Lang & McLellan. With increaeed machinery for mining and milling, this mine will no doubt astonish the mining fraternity of the whole coast.

Other Mines.

The Ready Relief mine hae a five foot lode of splendid rock that will pay from sixty to one hundred dollars per ton in free gold. The company have a small water mill which they propose to increase shortly. The Stonewall Jackson mine has a mese of ore varying from three to twenty-six feet in width; their main ehaft is down one hnndred sixty feet. The company, the Messrs. Frary & Farley, have a ten etamp mill and hoisting works on their mine. The mill is running constantly day and night. The Owens mine have a shaft on their mine over three hundred feet in depth, and have a very fiue body of ore that will pay about forty dollars per ton, and the lode is abont five feet wide; the company have fine machinery on their mine.

The Helvetia company have a shaft on their mine about three hundred feet in depth; their lode ie two and one-half feet in width, the rock of which will pay ahout thirty dollars per ton. The company have temporarily suspended work on their mine nntil they shall have erected etsam hoisting works.

The Mammoth Tnnnel and Mining company ars running a tunnel in what is known here as the Big Blue Hill. This company will have to rnu their tunnel about four hundred and fifty feet more before striking the lode, ths croppings of which havs yielded over fifty thousand dollars from less than fivs hnndred tons of ore. The Tom Scott mine is a very promising mine; the company are engaged at present running levels from their one hundred foot level; their ore pays ahont thirty-five dollars per ton. The Pride of the West are taking out ore from near the surface which pays fifty dollars per ton. I will try and keep you posted in regard to our mines from time to time.

J. S. L.

Julian City, Dec. 10, 1873.

Julian and Banner Districts.

EDITORE PRESS:—Onr mining districts, Jnlian and Banner, have jnst been made glad with the good news that the miners have at last beaten the owners of the Cuynmaca grant, and the land is now theirs. This will canse renewed vigor in Julian, where the grant tried to take both mines and timber; now the miners have both and can work without fear. Capital will also come in and we soon ehall see Jnlian a lively mining town, and Banner will not be behind. It is here that the famons Chariot mine is situated, also the Ready Relief, Antelope and several other of the best mines in the country. The Chariot mill is at present shut down on account of the late storm, which has made it impossible for the teame to hanl ore to the mill. When running their five stamps, they turn out from ten to twenty-five thonsand dollars per month. The ledge is from eix to fonrteen feet wide and all pay ore.

The Ready Relief ie a good mine, from one to eix feet wide and rich rock. Their water-power mill rnne night and day.

The Antelope mine has just bsen leased for three years to some parties who intend seeing what it is. This was for a long time the richest mine in the county, but had mauagement has had the sway and the mine left undeveloped, bnt it will now be worked hy miners who know how.

In Julian the Helvetia mine is to have a new mill and hoisting works immediately, and hoisting worke on the Owens mine will eoon be under steam once more. Capital seems to be coming in, and the late storms, which will insure the farmers good crops, will make lively times for this part of the county. Since the third of Decemher, fifteen inches of rain have fallen in Banner, and more in Julian. San Diego county will raise large crops this year.

OBSERVER.

The Meadow Valley Company's Mill.

Undaunted by the heavy weather, onr reporter availed himself on Sunday of the invitation of Mr. Tyrrell, euperintendent of the Meadow Valley Mining Company, to visit Lyonsville, Dry Valley, ahout ten milee distant, to inspect the mill and other property of the Meadow Valley Company at that place. Coneidering the inclemency of the eeason, the trip was a very pleaeant one, heing provided with such wrappings as are indispensable under euch circumstances. Lyonsville is quite a village, when to the mill and various workshops belonging to the company, are added the twenty honses or more dwellings occupied principally by the employés of the company. The village hae two stores, one Chineee restanrant, and a hoarding-honse, under the menagement of Mrs. C. B. Barstow, where are ample accommodations for forty or fifty hoarders.

The company's worke consist of the mill, with six batteries of five stampe each; foundry and machine shop, retort and melting room, assay office, carpenter shop and blacksmith ehop. Everything conuected with the works is first-class, and the company, by the sole aid of the workmen in its employ, can make all needed repairs. The foundry turne ont all the castings reqnired with expedition and of the very first quality. The water used in the generation of the steam by which the mill is kept iu motion ie hronght in a flume from a distance of three and one-half miles above. A eteam pipe ie run from the mill to the fonndry, a distance of five hundred yarde, eo that one set of engines keeps both mill and fonndry going. The mill is kept rnnning principally on oree from the Meadow Valley mine, which are hauled to the mill by teams. They employ for that pnrpose a large number of drivers, as well as horses and mnles. Some enstom work is also done, but not a great deal, as the yield of the Meadow Valley mine ie snfficient to keep the mill in motion. While the enow lasts, a eleigh ride to Lyonsville would be qnite a pleasant pastime, and in fine weether, when the roads are firm, no better way could be found to pass an idle day than to take a ride to Lyonsville and view the extensive works erected by the Meadow Valley Mill and Mining Company. A colossal sum has been invested by the company in the erection of the mill and other works, and it is the desire of every well-wieher of this camp that the investment may prove a remnnerative one. The company has over $25,000 worth of wood piled np for future use.

—*Pioche Record.*

Amador Canal.

Ws have from time to time received lettsrs from diffsrent localities making inqnries in rsgard to ths above named canal, the extent of country for mining, agricnltnral and mechanical purposes, to which its waters can be carried and mads available. In former issues we have frequsntly referred to the canal in a general way, but persons unacqneinted with that important enterprise wonld not be fully informed of its extent and capacity of snpply, merely from these references, and we feel justified in again bringing the canal before our readers.

The canal was begun some four years ago nnder the name of the Sutter Canal, and under its former owners wae completed to within eight miles of the point on the north fork of the Mokelumne river, from which stream, the canal will be supplied with water. The old company became embarrassed, and nntil recently, work had entirely ceased. The present company, who succeeded to all the rights of the orignal owners, took charge of the works only a few weeke ago and have let contracts to complete the last remaining eight milee that will bring the canal to its sonrce of supply. A large force of men are now, and have for eome weeke past, been actively engaged in the finishing work. The oanal in size, exclnsive of embankment, is eight feet on top, five feet on the hottom, and four feet in depth, and will we are informed, convey about 3,000 inches of water.

In length, from the point where it taps the north fork, following its sinuosities to the distributing reservoir on the divide on the sonth side of the stream above the town of Sutter Creek, the canal is 46 miles. Along the line of the canal and within reach of its waters, are large bodies of land susceptible of cnltivation either in vineyards, orcharde or vegetable gardens. The distrihuting reservoir being npon an elevated ridge, the water from this point by lateral ditches, can be distributed over a vast area of country for nse in all indnetries where the agency of water may be reqnired. It is estimated that the waters of the canal can be distributed over more than one half of the popnlated portion of the country. Along the line of the canal and within reach of the distrihnting reservoir, are extensive gravel hille that will ere long be worked profitably by hydranlic proces employing a great many men. But, our object in thie article ie to give persons who are not conversant with the canal some idea of its extent and capacity as well as of the natnre and character of the lands that can be reached by ite waters. Lande well adapted to vineyards, orchards and gardens, can be had along the canal by eimply settling npon them, and on these lands hy industry, valnable homes can be made and profit realized from the labor of cultivation. When the canal shall be completed, which will he in time to farnieh water for all purposes by early spring, a wide field will he opened np for varione industries, farming, gardening, mining, orcharde and vineyards, and with proper indnstry homes can soon be made which for comfort and profit cannot be surpassed in the State. For families, or yonng men with moderate means, or only industry and perseverance, here is the place for you ahove all others.—*Amador Ledger.*

CONSUMPTION OF HORSE-FLESH IN FRANCE.—According to the report of the Comité De la Viande de Cheval, there were consumed in Paris during the first half of the year 1897, 893 horses, asses and mnles, which supplied 106,030 kilogrammes of meat; during the ffrst half-year of 1870 (before the war), 1,992 animals were slaughtered, giving 366,440 kilogrammes of meat; lastly, during the first half of the present year, the figures amonnted respectively to 5,186 animale and 883,844 kilogrammes—not including hearts, livere, brains, tongues, etc. which are coneumed in common with those of meat cattle. The provinces exhibit, says the report, the same progress as the capital in the consnmption of horse-flesh. Horses elanghtered for consumption, fetch on an average from 125 to 150 francs each, so that the industry has added 100 francs per head to the value of worn ont, bnt not diseased horsee. In the words of the report, the pnblic wealth of France ie increased by the eating of horse-beef to the extent of 480 millione of francs. It is beyond question that horee-meat is received with considerahle favor in France, hnt the high price of bntcher's meat and general impoverishment, have doubtless considerably aided the progress of horse-butchery.

THE KEARSING MILL.—This mill having been put in excellent order and condition, has for the past few days been ponnding and grinding away on the large lot of "gonge" and refuse rock obtained from the Kennedy mine. Messrs. Kearsing Bro. and Mr. Gonway, have now at the mill 300 tone of rock and gonge from the Kennedy, and are crushing and grinding at the rate of nine tons in twenty-fonr honre' run. Judging from the gold to be seen on the plates in front of the battery, we can eafely predict a good yield from the rock and gouge now heing crushed and gronud. We herdly think any mill in the county can snrpass the Kearsing mill in saving snlphurete and fine gold, the machinery and pane for this pnrpose heing so arranged that the snlphurets are not only graded as to fineness, but it seems impoeeible for them to escape in any appreciable qnantity.—*Amador Ledger.*

MECHANICAL PROGRESS.

Aluminum as a Material for Balloons.

A writer in the N. Y. *Journal of Commerce* makes a suggestion which, if not original, merits attention:

Before dismissing "The Balloon" to the limbo of old sensations, it is worth while to inquire whether some material for the making of aerostats could not be found better than the fabrics commonly used. The objections to silk or cotton are these—that, no matter how carefully varnished or oiled, they permit the escape of gas; that they are not strong enough to resist the pressure of the gas, when made beyond a certain size; that they are easily torn; that they absorb moisture when passing through the clouds, fog or rain, necessitating the sacrifice of ballast in order to rise into sunshine, and then, as they rapidly dry, requiring the release of gas in order to check their upward flight. With silk or cotton balloons there is a constant alteration of pitching out ballast and letting off gas. Consequently, it is indispensable to put a large surplus of gas in the balloon, and also to take a large amount of ballast, or spare weight of some kind. One of the most serious obstacles to voyaging over the Atlantic in a balloon—to say nothing hero of hitting and keeping an easterly wind—is the steady, inevitable loss of gas that occurs.

If this problem of transatlantic ballooning is to be seriously attacked, the first and indispensable thing is to make a balloon free from all the objections we have mentioned. We suggest that the (comparatively) new metal, aluminum, may be found to meet the want. Its specific gravity is about one-eighth of that of gold, a fourth of silver, and less than a third of copper. It weighs less than common glass, and but little over twice as much as sea-water. Lightness is not one of the good qualities of this extraordinary metal. It is malleable like gold, and may be hammered or rolled out in sheets of extreme tenuity; and yet it is stronger and more tenacious than iron itself. Furthermore, it resists the oxidizing influence of the atmosphere. It does not rust or corrode under any circumstances, and is proof against the most biting acids in the cold. Our purpose here is not to throw ont the hint; those particularly interested in aeronantics can follow it up if they like. But there seems to be no good reason (unless the one of expense) why a balloon, or at least the upper and more exposed half, could not be successfully made from aluminum. It would not leak; it would not tear; it would last forever, barring accidents in landing, and then, if injured, it could be easily repaired. There would be some mechanical advantages in the use of a metal balloon. The valve at the top could be more accurately fitted and worked than it is at present, and automatic safety valves could be provided to relieve the balloon from too great a pressure, also gauges to mark the pressure during the process of filling. These are incidental considerations. The chief object gained is the saving of gas, and if gas can be saved up, then it is not necessary to make a very large balloon or to take along a great dead weight of ballast.

With an aluminum envelope above him, the aeronant might float about for weeks or months. It would be an advantage with this form of balloon, more than any other, to use pure hydrogen, which is considerably lighter than the street gas. Assuming, as we do, that it is possible to make a balloon of aluminum by rolling that tenacious metal down to the proper thinness, the question of expense comes into play. There is no aluminum made in this country, and none seen here save in the form of delicate balances, mathematical instruments, bronzes and ornaments. The crude article has no quoted market price in England or France, which are the chief places of manufacture. The metal is produced on a small scale now, the demand being limited, and the price is necessarily higher than that of copper or tin. It was reported some time ago that, by a new method, the cost of manufacture had been greatly cheapened, and that aluminum would soon be taking the place of other metals for some of the commonest uses. Its source of supply is unlimited. All varieties of clay contain it in abundance. It is one of the most widely distributed of the elements, though never found in a native state, but always as a carbonate or silicate, or in some other compound condition. At present prices it might be too costly for use in the quantity required for a balloon; though, as it is indestructible, there would be true economy in using it for repeated aeronantic exhibitions. If anybody to whom money is no object has his mind bent on making an air trip to Europe, he would do well to look into this subject of an aluminum balloon before committing himself too far to the hazardous enterprise.

New Churn.—A Kentuckian has invented a churn which causes the butter to appear in a very short time. The dasher-shaft, to which is attached wide arms slightly inclined, revolves in a tube, the top of which is slightly above the surface of the milk. When set in motion, the milk runs over the top and comes into the tub again from the bottom, thus causing a continuous circulation and violent agitation.

The Tunnel between England and France.

M. Deseilligny, the French Minister of Public Works, has addressed a circular to the French Prefects respecting the proposed submarine channel railway, between France and England, which is to be laid in a tunnel 34,400 metres in length, to be connected with existing railways of each country by means of subterranean lines to measure in length ten kilometres in England, and as many in France. The circular interests more immediately the Prefect of the Pas-de-Calais, but has nevertheless been addressed to the remaining local officers, requesting them to submit the plan to their respective Chambers of Commerce. Previous to the late war the company which has undertaken to build this international tunnel had petitioned the governments of England and France for aid, and for a perpetual right of way to the exclusion of every other similar international sub-marine route. Financial aid was then declined by Franco. The subsequent war threw the entire scheme into the background, and only quite recently has it been taken up again, and is now being pushed with vigor. The governments of England and France have since entered upon an exchange of views upon the subject, and while the company of its own accord waives all pretensions to financial aid from France, it still presses its petition for an exclusive right of way in perpetuity, although it is agreed by both governments that it would be inexpedient and improper to give it a permanent monopoly. Important international questions having been raised, such as the use and control of the tunnel in case of war, it will have to be discussed in the legislatures of both countries, and the circular of the French Minister is the first step toward popularizing the scheme in France.

Anthon's Sewer-Gas Trap.—This invention consists of a box, preferably cylindrical in form, and open at the top. Into the bottom of this box, the pipe leading to the sewer is inserted, which pipe extends up to some distance above the bottom. Into the side of the box, the waste-pipe from the basin, tub or sink is led, having its open end at a lower level than the upper end of the sewer-pipe. The sewer-pipe may enter at the side of the box as well as at the bottom, always provided that its open end is higher than the open end of the waste-pipe. Upon the top of the box is fitted a closely fitting cover, which is used to exclude the gases and prevent overflow through the waste-pipe, in case the sewer-pipe becomes partially closed. The cover is held by a bayonet joint to the body of the trap. The cover has an outer flange extending nearly to the bottom of the trap. The inner flange has an annular bottom. The fluid from the waste-pipe, rising around and above the bottom edge of the inner flange of the cover, effectually seals the trap, so that no gases can escape, except by forcing off the cover. It will be seen that it is impossible for this trap to syphon out—as it is called—a difficulty with the old style of sewer gas traps, which when it occurs, leaves no obstacle to the escape of sewer gas into the house.—*Scien. Amer.*

A Wonderful Agricultural Machine.—Here is what an English exchange—*Iron*—says about a reported invention: "Our enterprising American cousins are not content with machines designed to perform ordinary operations in agriculture, but they devise extraordinary operations, and then proceed to invent machines to carry them out. In this country we are satisfied to wait a while after reaping before we begin to plough for another crop. At St. Louis, a machine is being built which is designed to cut and take up grain, and at the same time to plough and seed the ground. Surely the ingenuity of agricultural machinists cannot transcend this."

We hear of the construction at Cronstadt of a submarine vessel of enormous dimensions, in which two thousand tons of iron and steel have been employed, which is propelled by two powerful air-engines, will be armed with a powerful ram, and will carry all the means for fixing to the hulls of vessels large cylinders of powder which it can afterwards explode by electricity. Two glass eyes will enable the crew to find their way about, and they may choose their course at what depth they please below water.

Mr. Friedrich Asthoewer, engineer, of Witten, Prussia, in the construction of steel rails, combines hard ingots or blocks of steel, in the process of casting, with laminæ of soft steel or wrought iron, in such a manner that the latter, in undergoing the rolling process, may assume an internal position; thus combining a certain amount of elasticity, ductility and toughness in the interior, in resistance to fracture, with a hard exterior to undergo wear and abrasion. The details of the process—not the idea—are new.

Another Perpetual Motion. — J. W. S. writes to the *Scientific American* to say that he has a perpetual motion in running order, and he will dispose of it for $2,000,000 for a "plot;" but if he has to carry it to Washington, he will ask $5,000,000. The *Scientific American* replies: "The existing financial crisis will, we fear, prevent our correspondent from receiving either of the sums he mentions."

SCIENTIFIC PROGRESS.

On Atmospheric Ozone.

M. Houzeau, a distinguished French physicist, has made critical examination of that elusive substance, ozone. In a paper written by him, a portion of which we republish, the author, after giving a history of the researches upon atmospheric ozone since its discovery by Schoubein, describes the reagent with which his own observations have been made, namely, red litmus-paper impregnated over half its surface with a one per cent. neutral solution of potassium iodide.

This paper in contact with ozone assumes a blue color only in the part impregnated with the iodide, this change of color being due, not to the liberation of iodine, but to oxidation of potassium, the alkali thus formed changing the color of the litmus. In this respect the iodized litmus-paper is preferable to iodized starch-paper (Schonbein's reagent), which turns blue when the iodine is set free, and will therefore exhibit this reaction over its entire surface under the influence of free acids, especially nitrous acid, as well as of ozone. The part of the litmus-paper which is not iodized serves to reveal the accidental presence in the air of alkaline vapors (free ammonia, ammonium carbonate, etc.), which turn the red litmus-paper blue throughout its whole length; it is impossible, therefore, to mistake the indications. Moreover, the iodized litmus-paper cannot be turned blue by chlorine, bromine, etc., since chloride and bromide of potassium are neutral.

From a large number of observations made with this reagent in various localities and at different times of the year, the following conclusions are drawn:—

1. The air of the country contains an odoriferous and oxidizing principle which imparts to it a peculiar odor, and the power of blueing iodized red litmus-paper; also of decolorizing blue litmus-paper without previously reddening it; and of destroying certain bad smells.
2. That this principle is ozone.
3. That ozone exists in the air normally, but that the intensity with which it acts at any given point of the atmosphere is often very variable.
4. That the air of the country contains at most about 1-450000 of its weight, or 1-700000 of its volume of ozone.
5. That the manifestation of ozone by all the iodized litmus-papers is much more frequent in the country than in town.
6. That this difference may be due to the greater circulation of air in the fields.
7. That at Rouen, the frequency of the ozone-manifestations varies with the seasons, being greatest in spring, strong in summer, weaker in autumn, and still weaker in winter.
8. The maximum of ozone manifestation occurs in May and June (15 ozone days per month), and the minimum in December and January (4 ozone days per month).
9. That with respect to the frequency of ozone manifestations the meteorological year in our climates, may be divided into two great seasons: the *very active season* (spring and summer), comprizing 78 ozone days, and the *feebly active season* (autumn and winter), including 32.
10. That in general ozone shows itself most frequently on rainy days (48 ozone days in a hundred of rain, to 28 in a hundred of fine weather).
11. That winds, according to their strength, exert the greatest influence on the manifestation of ozone (24 ozone days in 100 when the air was calm or but slightly agitated, and 60 in 100 when the air was greatly disturbed).
12. That at Rouen, the largest number of ozone days occur when the wind is in the west or southwest, the smallest number when it is in the east.
13. That most frequently an exaggerated manifestation of ozone is in intimate relation to the great atmospheric perturbations, known as storms, gales and hurricanes.
14. That these great commotions of the atmosphere act at very great distances. Sometimes they momentarily effect the ozone of entire towns and localities, which nevertheless continue to enjoy very fine weather.
15. That atmospheric electricity appears to be the most active cause of the formation of atmospheric ozone.

Coating Fabrics with Tin.—According to Richard Jacobsen, linen and cotton goods may be covered with a thick and flexible film of tin, which gives to them a very silvery appearance. The method to be adopted is as follows: Ordinary commercial zinc-dust is rubbed up with a solution of egg albumen to a thin paste, and applied to the goods with a brush or roller. When dry, this coating is fixed by coagulating the albumen with steam, and the fabric is then placed in a solution of bichloride of tin. The tin is precipitated upon the zinc in a very finely divided state. The stuff is then washed with water, and, after drying, put through the finishing-machine, when the tin comes out with a brilliant luster. A very beautiful effect may be produced by printing different designs in this way, or applying the material with stencil plates, and its use may be extended to decorations. It is even possible that this strong, elegant, and waterproof material may yet replace tin-foil for packing certain articles.

Flooding the Sahara.

The following letter of M. Tallichet to the editor of *Appleton's Journal* explains itself. The position maintained by the writer appears to be perfectly tenable. Would anyone but a Frenchman originate the idea of flooding the great desert for climatic improvement?

Having read in the "Scientific Notes" for your issue of November 1st a paragraph on a paper read before the French Geographical Society by Captain Baudelaire, in which he urges the feasibility of creating an interior sea in the Desert of Sahara, will you allow me the privilege of asking, through your valuable paper, the answer to one question—not as to the feasibility of the plan, but as to its ultimate effects upon Europe after it is accomplished?

It is a well-known fact that the direct rays of the sun do but little toward melting the snow and ice accumulated on the Alps during the winter; and all persons who have lived in Switzerland know that the wind called *Vaudaire, or Föhn*, which is the dying breath of the African simoom, often causes the waters of the lake of Geneva and other Alpine reservoirs to rise several feet in the course of twenty-four or thirty-six hours, and thus shows that wind to be the chief agent in reducing the Alpine glaciers.

If the Sahara, instead of being a desert, were a sea, would the simoom still reach the Alps? And if it did, would its heat not be so considerably reduced as to have little or no effect upon the glaciers? And is it not a safe speculation to make that the glaciers would, in course of time, spread all over Switzerland, and perhaps over a large part of Europe?

A point in favor of my theory is, that all geographers concede the Sahara to be the bed of a dried-up inland sea; while eminent scientists see in the granite boulders found over a large portion of Europe a proof that, during a prehistoric period, all that country was covered with glaciers. Is it not safe to argue that these two facts were cause and effect, and that, by restoring the cause by the creation of an inland sea in Africa, the climate of Europe would be most seriously affected?

A Step Forward.—It is announced that Mr. A Ladiguin, of St. Petersburg, has overcome the difficulties which have hitherto stood in the way of applying the magneto-electric light to the purposes of illumination. He has constructed a machine, rotated by a three-horse power engine, which, he declares, can keep several hundred lamps going, the lights being regulated by a simple contrivance. Hitherto the want of steadiness has been objectionable, and was caused by its dependence on the uniform proximity of two carbon points, which, when heated by the current and exposed the air, were rapidly burnt away. In Mr. Ladiguin's invention, only one piece of charcoal is necessary. This is connected with the electro-magnetic machine, and inclosed in a glass tube from which the air is extracted. The tube is then filled with gas which will not combine with the charcoal at a high temperature, and hermetically sealed. On the machine being set in motion the charcoal becomes gradually and equally heated, and emits a soft, steady light, which will burn at the bottom of a mine, or even at the bottom of a river, as readily as in a street lamp, and at about one-fifth of the cost of coal gas. It is said that this discovery is at once practical and simple, and it is to be experimented on in Paris, Vienna and London with little further delay. Even as a safety lamp in mines its value would be incalculable if it stands the test of trial.

An English exchange has the following description of an ingenious, but most likely impracticable process for economizing fuel in puddling and blast furnace uses: "Mr. W. Mickle, of Tynemouth, proposes to draw coke from a retort (in which coal has been treated by dry distillation) at a red or white heat, into iron tubs, without having it cooled by water, and to convey it to the smelting furnace, to be used as fuel. With the coke he proposes to combine the use of coal gas and the naptha or other combustible oil or spirit obtained from the coal used for smelting, the gas being pumped from an ordinary gasholder erected for the purpose, by engine power, and conveyed into the furnace through pipes and tuyeres in the usual manner. By this process, which he also proposes to apply to puddling furnaces, Mr. Mickle expects to dispense with calcining and heating stoves; to diminish the available air-blast power required about one-fourth, and to make eight to ten cwt. of the gas produced and heated coke sufficient to melt one ton of metal, inclusive of what is required for the deoxidation of the ore and the carburization of metal."

The success of micro-photography, as a means of transmitting dispatches, so clearly demonstrated during the Franco-Prussian war, has suggested to a French engineer the possibility of establishing a general system of communication on this principle. In order to effect this, it is proposed to reduce messages photographically to microscopic size, and then, having inclosed them in metallic spheres or other vessels, to blow them through a tube under the Straits of Dover. At the office where the message is received, it would again be restored to full size, and would then be forwarded by post or regular telegraph. As the two systems here combined have both been successfully tested, there seems no reason why the scheme should not prove a success. A point in its favor is that, in case the conveying vessel is a sphere, the tube need not of necessity lie in a straight line, provided the curves be not too abrupt.

Our Weekly Stock Review.

WEDNESDAY EVE., Dec. 24, 1873.

There has been a very large business done in mining stocks during the past week, and prices have been high and sales active. The expectation that all the mines on the Comstock will eventually make developments on the continuous ore body of the lodge, has quickened transactions in their stocks and inspired confidence in the mines. This rise in values has caused an increase in the number of new incorporations which have filed their certificates during the past few weeks. Some of these may be valuable; others again are doubtless "wild cats."

The development in Ophir has been one of the exciting features of the past few weeks. This development, with that of others recently, is important, as it shows the permanency of the ore deposits in the Comstock. This is referred to more at length in our "Mining Summary" in this issue. A special meeting of the Ophir Company has been called for the 21st of January, to take into consideration and decide upon the proposition to increase the capital stock of said company from $5,040,000, divided into 16,800 shares of the par value of $300 per share, the present capital stock of the company, to $10,080,000, divided into 100,800 shares of the par value of $100 per share.

The dispute between the Belchor and Crown Point companies, relative to the boundary line between them and the ore alleged to have been taken by the Belcher from the Crown Point through an incorrect survey, has been finally and satisfactorily compromised, by the Belcher company agreeing to pay the Crown Point $275,000 and relinquishing all claim to the ground in dispute. According to the most accurate survey, the Belcher company were found to have worked fifteen feet over their line at their 1,400 or lowest working level, and a proportionately less number of feet at each level above, up to the 900-foot level, where the variation commenced. The dispute was amicably settled, without resort to law or the courts, and the money has been paid.

In speaking of the developments on the Comstock, the *Alta* says that the developments that are making along the whole ledge at great depths are gradually demonstrating the continuity of the ore at perhaps a level of 2,000 feet. It has become pretty well settled that the ledge extending from the Sierra Nevada on the north, running south to the Seg. Belcher and Overman, curves towards Silver City, embracing what is known as the Lower Comstock mines, making three distinct sections—the Virginia mines, the Gold Hill and the Lower Comstock. These latter mines are now coming into notice under very favorable circumstances, including the Justice, Silver Hill, Dayton, Kossuth, Genessee, Daney, etc. The descent of the ground in that direction is rapid, and the distinct vein of the Comstock crops out at lesser depths than above, directing attention towards it by many, who think the Lower Comstock will be, in the future, by no means the least productive portion of the great Comstock ledge.

As showing the buoyancy of the market we quote the closing prices of the 22d: Best and Belcher was $4 higher than on the previous days; Belcher, $3; Crown Point, $1; Con. Virginia, $4; Central No. 2, $4; Challar, $3; Gould & Curry, $1; Ophir, $6; Overman, $20; Caledonia, $7; Central, $10; Hale & Norcross, $12; Savage, $10; Jacket, $5.

At the close of Tuesday's Board Best & Belcher was $2.50 higher; Belcher, $1; Crown Point, $5; Challar, $8; Con. Virginia, $1, Gould & Curry, $3; Savage, $12; Hale & Norcross, $3; Ophir, $30; Central, $3; Overman, $2; Seg. Belcher, $2.

Our Stock Tables show the Market Prices only up to Tuesday night this week, as we go to press one day earlier than usual, on account of the holidays; and, moreover, the Stock Board only holds one session on Wednesday.

Notices of Recent Patents.

Among the Patents recently obtained through Dewey & Co's. MINING AND SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

WIRE ROPE TRAMWAYS.—C. W. E. Bunster, Valparaiso, Chili. This invention relates to an improved pulley for supporting the endless wire rope which is used for transporting anhstances from one place to another, and consists of two pulleys, each of which is provided with inclined fingers forming an inverted conical series of flats. The two pulleys are so arranged that their fingers interlock and serve as teeth to drive each other, and also to support the wire rope in the angle formed by their covering each other. By this means the load can be depended in a direct line below the wire rope, and the hanger or connecting rod will pass between the fingers of the pulleys readily.

HYDRAULIC ELEVATOR.—Philip Hinkle, San Francisco, Cal. This patent covers a novel application of hydraulic power for raising and lowering a cage or platform for hoisting purposes, and is especially useful for operating a passenger hoist. One or more cylinders are mounted on wheels, and the wheels move on a track similar to an ordinary railway track. Each cylinder is provided with a stationary piston and hollow piston rod. Water is admitted between the stationary piston and end of the cylinder through the hollow piston rod, so that the pressure causes the cylinder to travel on its track and raise the cage or platform. By releasing the water from the cylinder the weight of the descending cage will draw the cylinder back to its first position.

SHEEP SHEARS.—Andrew S. McWilliams, Colusa, Cal. Mr. McWilliams provides ordinary sheep shears with an elastic thumb plate and rest upon one branch of the shears and finger saddle upon the opposite branch, so that the operator will have a better grasp upon the shears, while his fingers and thumb, being provided with convenient and neatly fitting seats, will not become fatigued by the operation of shearing, while they also form guards and prevent accident to the fingers and thumb.

STEAM PLOW.—P. J. McDonald, San Francisco, Cal. In this invention Mr. McDonald combines the English Fowler system of operating steam plows with the American system of dragging a series of plows after a traction engine over the field. Mr. McDonald provides an ordinary traction engine with ways or guiding beams extending twenty or thirty feet upon each side of the engine. The plows to any desired number are mounted upon these ways and are drawn by a rope towards each other and towards the engine. After making each cut of forty or sixty feet, the plows are hauled back along the ways by another rope to the outer end of the ways, ready to make another cut. While the two gangs of plows are in the ground and moving towards each other, the engine remains stationary, but when the plows are being hauled to the outer ends of the ways, empty, the engine moves forward to the proper position to give the plows a new land. The main driving shaft is driven uniformly in one direction by the engine, and the changes of motion necessary to move the plows back and forth along the ways, are accomplished by ingeniously arranged mechanism, which is very simple and effective. Thus the engine alternately moves forward into position and remains stationary, while the plows are working, cutting a land of forty or sixty feet in width as it proceeds according to the length of the ways employed.

SADDLE FOR WIRE ROPEWAYS.—Thomas M. Martin, San Francisco, Cal. This invention relates to a saddle for supporting the load upon wire ropeways, which is provided with an inside lining of india-rubber, for the purpose of giving great adhesion to the rope, as well as a perfect seat of the saddle upon the rope.

TYPE.—William Shaw, Holliater, Monterey Co., Cal. This invention is intended for the benefit of printers, and it consists in making types with a small shoulder at some point of their length, so that in correcting a "proof" any letter can be readily removed by inserting a thin hooklike having a hook formed on its end, so that the hook will catch upon the shoulder and allow the type to be raised vertically without disturbing any of the adjoining type.

SCRUBBING BRUSH AND MOP COMBINED.—J. D. Smith, Sacramento, Cal. This invention is intended to benefit housekeepers, and it consists of a very neat long handled scrubbing brush, which is combined with a mop cloth so that the entire operation of scrubbing, mopping and wringing the mop cloth can be done without knee work, as is usually necessary in order to do good work.

DEVICE FOR UNLOADING HEADER WAGONS.—Richard Threlfall, Centerville, Cal. Heretofore header wagons have been unloaded by means of forks operated from a swinging derrick or crane, but this method is too slow to keep the threshers supplied with a uniform feed. Mr. Threlfall proposes to spread a netting or other fabric over the bottom of the wagon bed and fill the grain into the wagon bed upon the netting, and when it is desired to unload the grain the corners of the netting or fabric are gathered together, and the crane employed for lifting the entire load out at one operation.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior,in proximity to the mines mentioned.

California.

ALPINE COUNTY.

MINING.—*Miner*, Dec. 20: The continued storm and cold weather have prevented any new movements duriag the week. The M. & N. W. mill was started, and worked part of a day on some old concentrations that have been lying at the mill more than a year, but the cold was so intense and ice formed so rapidly in the pipes and about the machinery that Mr. White deemed it prudent to discontinue work until the weather should moderate. In the Silver Glance shaft work goes on steadily. There has been a marked change in the ground since leaving the 100-foot level. Quartz with seams and feeders is daily coming in from the north and pitchiag south, with frequent pockets of good ore. A piece of this stuff taken from a bucket, and not selected, assayed by Mr. White, showed a value of $46.80 in silver, with a decided trace of gold. This rock carries less base metal, and works much freer than anything before taken from the mine.

AMADOR COUNTY.

VALPARAISO MINE.—Amador *Ledger*, Dec. 20: By late advices from Fiddletown, we are pleased to learn that the Valparaiso mine is looking remarkably well. At the present depth of the shaft, the ledge is full 4 feet thick, and the ore of excellent quality.

CALAVERAS COUNTY.

BIG BLAST.—*Chronicle*, Dec. 20: Sixteen barrels of powder were exploded in the Daryea claim, last Saturday, for the purpose of shattering the bank of gravel. A transverse drift was run across the end of an old tunnel that extended from a gulch into the hill to within about 20 feet of the face of the bank, in which the powder was placed. The blast did no execution, however, owing to the fact that the tamping blew out. The experiment is to be tried again.

RAILROAD FLAT DISTRICT. — No notable changes at the Sanderson mine. The 200-ft. north level is in 50 ft., indicating the vicinity of another body of ore. The 200-ft. south level is in 70 ft., ore in the face rich as ever. The horizontal extent of this body is now 107 ft. Raise in south level, up 22 ft., shows a uniform abundance of the precious metal. The mine will be supplied with an Ingersoll drill in a few days—the first on this Coast. Some very handsome ore is being shipped to San Francisco.

WEST POINT DISTRICT.—In spite of the severe storm, a new company have been preparing to reopen an old mine at Anderson's Flat. Operations will be inaugurated by horse power, a steam engine to take its place in the spring.—Nothing of note, otherwise.

MARIPOSA COUNTY.

GOOD FOR MINERS.—*Gazette*, Dec. 20: The rains of the past ten days, and the heavy fall of snow in the mountains, assure a plentiful supply of water for placer miners. Quite a number of old miners, who have "summered" on the plains, have returned and are placing their sluice boxes in position for a winter campaign.

QUIT WORK.—We learn that work has again suspended on the Francis mine—nothing being found to remunerate the owners for the money being expended.

NEVADA COUNTY.

MAGENTA MINE.—*Union*, Dec. 20: The work of opening the second level in the Magenta mine, at the depth of 210 ft., has been commenced, and the rock gives every indication that it will realize in richness the most sanguine expectations of its shareholders. The little rock yet taken out is wonderfully heavy in galena and sulphurets, which contain an abundance of gold. The ledge is 18 inches in thickness, well-defined and more regularly in places than upon the first or upper level. Drifting upon the second will be prosecuted vigorously, in order to be ready for stoping out as soon as possible.

PLUMAS COUNTY.

LET US REJOICE. — *National*, Dec. 21: The stormy season has arrived, and gives every indication that the prayers of the miners for a "huge old winter" are about to be answered. Let it come, for God knows they need it, and when the miners fail everything else looks "blue." The weather-wise people and the old "croakers" had decided on having another dry winter. The steady, heavy rain which commenced on Friday last, and the snow which has since fallen, have scattered their gloomy forebodings to the winds, and now, in the place of long faces, a feeling of security and of strong hope for the future has filled the minds of our people. A hundred rich placer claims in this section are to-day waiting for water. The owners have already had to stand the brunt of two or three hard winters, and are sadly behind. One good season will make the most of them even, and the present weather promises that that season is at hand. Let it come, and it will prove that the hills and gulches of Plumas contain more treasure than any mining county in the State.

GOOD PROSPECTS.—Messrs. Garland & Dow, whose gravel claims are located on Quien Sabe ravine, about two miles from Spanish ranch, have been fitting up for several months past, and are now all ready for water. They have put on upwards of $2,500 worth of improvements, in the shape of iron pipe, flumes, ditches a little giant, etc., and, judging from the prospects obtained last fall, will open an exceedingly rich and extensive claim. They have splendid natural advantages, dump, pressure, grade, etc., and there is no reason why the claim should not be largely remunerative.

TRINITY COUNTY.

RICH QUARTZ.—*Journal*, Dec. 20: John Seigfried, of Indian creek, was in town last Monday and showed us some pieces of quartz in which considerable free gold was visible. He says that himself and James Morris found the quartz during a recent prospecting trip in the mountains of that section, but storm coming on they were compelled to leave for home before ascertaining the extent of their discovery. They will return in the spring.

TUOLUMNE COUNTY.

THE EXCELSIOR.—Sonora *Democrat*, Dec. 20: This fine gravel claim, now owned by the El Dorado Water and Deep Gravel mining company, commenced hydraulic operations last Monday, with an abundant supply of water for present purposes and every assurance of a continuous supply throughout the winter. Prior to the commencement of the storm the claim had been put in first rate shape for profitable working; there is every reason to anticipate early reports of big clean-ups in that quarter, to be continued for more years than most of us can reasonably expect to live, as the richness of this mine has been established beyond a peradventure and the deposit is of vast extent.

ANOTHER STRIKE.—Shepherd and Whitten have opened another deposit of very rich ore in the old Shepherd claim, south of the Pacific mill. In richness, so far as developed, this surpasses any previous discovery in that neighborhood, showing an abundance of free gold in a coarse grained and remarkably porous quartz, heavily loaded with rich sulphurets.

RAW HIDE MINE.—*Independent*, Dec. 20: The water has been mastered at last in the shaft of this mine, and there is nothing to contend against now but the slum that oozes in from the sides, which will, however, be lagged up as speedily as possible. There is no perceptible increase of water on account of the recent heavy rains.

MOAR GOLD QUARTZ.—J. F. Irwin & Co., while prospecting, last Monday, on Wolfling's Hill, near the west side of the city boundary, picked up a large piece of curious slate bearing gold, and in digging two or three feet in an old hole found the vein. Nearly all the rock taken out thus far has more or less free gold in it.

Nevada.

WASHOE DISTRICT.

AMERICAN FLAT.—Gold Hill *News*, Dec. 20: Work on the 400-foot level has been suspended for almost the entire week for the purpose of adding a new hoisting reel to the machinery.

ARIZONA, UTAH AND GLOBE.—The face of the main west drift on the 400-foot level is in ore of a low grade, but shows improvement as the work advances. The south drift from the bottom of the main incline is also in ore of a fair grade.

BALTIMORE CONSOLIDATED.—The shaft is down 135 feet below the 400-foot level, the bottom in good sinking ground and excellent headway being made. There is no change of importance to report of the prospecting operations on the upper levels of the mine during the week.

BELCHER.—Daily yield, 450 tons. The ore breasts and stopes on the different levels never have yielded better or looked more promising for the future than at the present. The main south drift on the 1,300-level is in 525 feet south of the Crown Point line, still in quartz. The winze from the 1,200 to the 1,300-foot levels, is finished, passing the entire distance through good ore. The up-rise from the 850-foot level, has also made connection with the south drift on the 900 ft. level, greatly facilitating the ventilation of that part of the mine. The north drift on the 1,300-foot level to connect with the south drift on the same level from the Crown Point is in 241 feet, good headway being made.

CALEDONIA.—Repairing the main shaft is making rapid progress. Work has been resumed in the main drift at the 500-foot level. The up raise, and drifts connecting the 300 and 400-foot levels are being repaired for the purpose of keeping good the ventilation of the mine. The lower drain tunnel is being driven ahead at the rate of eight feet per day.

CHOLLAR-POTOSI.—Daily yield, 120 tons of ore, the assay value of which is $30 per ton. The ore breasts are looking quite as well as usual, but the dumps being full and the roads bad the teams are unable to haul the ore to the mills as fast as extracted. The quartz in the main southwest drift, at the third station, still continues of a very favorable character, although no rich and permanent body of ore has yet been encountered.

CONSOLIDATED VIRGINIA.—The north winze on the 1,200-foot level is down 140 feet, the bottom in fine ore. The raise from this level is up 135 feet, also in rich ore. The ore at both the bottom of the winze and the top of the raise shows a decided improvement over that heretofore encountered. There is no change in the character of the ore in the ore breasts both north and south on this level. The main east drift at the 1,000-ft. level is driven vigorously ahead without change of interest. The main drift on the 1,300-ft. level is also making excellent headway. The Trench mill at Silver City has commenced reducing ore from the mine. The daily yield of ore from the mine is being steadily increased in proportion as the crushing capacity is extended.

EUROPA.—Main west tunnel still being driven ahead in the back ledge.

GOULD & CURRY.—The main east drifts, on both the 1,500 and 1,600-ft. levels, are driven vigorously ahead, both in vein matter of a promising nature. The main east drift, on the 1,700-ft level, is making good progress, not yet having reached the west wall of the ore vein. No water to impede progress.

HALE & NORCROSS.—Sinking the main incline is making good progress. The exploring drifts on the lower levels are still prosecuted with the utmost vigor. The Hoosier State mill, adjacent to the mine, will be started up on ore from the mine in a very few days. The distance from the mine to the mill being so very short the stormy winter weather can cause no delay in the transportation of ore.

IMPERIAL.—Sinking the main incline is making good progress, the rock in the bottom blasting finely.

PIOTOU.—Work progresses satisfactorily with favorable indications.

JUSTICE.—The main north drift on the 300-ft. level is in clay and porphyry, with occasional streaks of fine ore. The east cross-cut, in the south winze on the 400-foot level, is still in quartz of a very promising character. The west cross-cut, from this winze, has reached the west wall, passing through 6 or 7 feet of low grade ore.

JULIA.—Both the southwest drifts on the 900-foot level are progressing at the usual good rate, with flattering prospects of good ore developments soon. The water in the shaft is subsiding.

KNICKERBOCKER.—The contract for the mason work of the foundations for the hoisting and pumping machinery is nearly completed. The work has been done in the most thorough and substantial manner. The heavy timbers are fitted and all ready to be put in place and the work will be hurried forward as fast as possible, in order that the further development of this valuable mine may be proceeded with at the earliest practicable opportunity.

KOSSUTH.—The main west drift is still driven vigorously ahead, cutting during the week stringers of fine looking quartz with strong indications of soon reaching the main ledge.

LADY BRYAN.—This famous mine, after several months quietude, is soon to be worked again, and under better and more favorable auspices than heretofore. The company has recently been re-incorporated with a capital stock of $5,000,000, divided into 50,000 shares of $100 each.

SAVAGE.—There is nothing new to report of this mine, except the steady and favorable progress of the main incline downward and the east cross-cut on the 1,600-foot level.

ELY DISTRICT.

AMERICAN FLAG.—Pioche *Record*, Dec. 13: Shipped during the past week $16,700 in bullion. Nothing is doing in the mine except to sink the main shaft, owing to the late heavy snow-storm and the difficulty of gathering timbers and material to work the mine. The shaft is now 73 feet below the eighth level and sinking continues with 8-hour shifts. New mullers and pan bottoms are being put into the mill, which will resume work by Tuesday. Also ready to receive custom work, and intend to give satisfactory results.

AMADOR MILL AND MINE.—The mill will start upon ore from the Washington & Creole mine to-day. The shaft of the Amador mine is now down 450 feet, and sinking is still going on.

ALPS.—The cross-cut at the 300-ft. level is now in about 500 ft. from the shaft. The winze at the second level still shows a good vein.

HUHN & HUNT.—Work is progressing as usual, with good indications.

INGOMAR.—Work in this mine will be resumed to-morrow (Monday).

MEADOW VALLEY.—No. 3 shaft down 1,081 ft., and sinking still continues as fast as possible. Running drift west from tenth station; now in 41 ft.; no change worthy of note in that drift. Running drift east from ninth station; now in 372 ft. Sinking winze from east drift of eighth station to the ninth station. East drift, on 8th station, in 418 feet. Good indications. East drift on 520 ft. level still being carried ahead. Summit shaft down 879 ft—rock very hard, progress slow. Running drift south from Summit shaft to connect with drift now being run west from the eighth station of No. 7. Teams loaded yesterday for the first time since the storm. Dump full of ore. Expect to continue shipping.

PEAVINE.—Drifting towards the new shaft is still under way, and it is expected that a connection will be made between this time and Christmas. Will commence to take out ore as soon as the connection is made.

PAGE & PANACA.—Busily engaged in putting in a station in the winze, so that a large force of men can be put to work and ores hoisted more expeditiously. The ledge struck the other day is improving. Assays made since our first notice of it show a yield of $1,969.78 to the ton.

PIOCHE.—The hoisting works have been moved from No. 9 to the new shaft a short distance east of the old Burke shaft. Still extracting ore in the old shaft, and hoisting will be commenced in a few days. We saw at Butler's assay office a very handsome bar of bullion just as it came from the mould, which is worth about $1,400, and was made from ore extracted from the Pioche mine.

SILVER PEAK.—Work is still progressing satisfactorily, and the prospects of the mine are generally good.

SPRING MOUNT.—In this mine work is being pushed energetically, without material change.

WASHINGTON AND CREOLE.—Sinking progresses on the prospect and west winzes, each of which has a good ledge, being of an average width of 2 ft., and containing rich chloride ore. Also drifting east and west and stoping up from the bottom of the two winzes in same character of ore. Drifting has progressed west from the prospect winze until a connection has been made with the Newark mine. The Washington & Creole ships to-day by Wells, Fargo & Co. $9,005 in bullion. The company is working about 50 men, and in addition to the work before mentioned the Mazeppa shaft is being sunk to connect with the Washington & Creole.

Idaho.

RED JACKET.—*Avalanche*, Dec. 13: The buildings are all completed, the steam hoisting works in full blast and everything in tip-top shape for the winter's operations. The mine continues to develop splendidly.

EMPIRE.—The 1st, 2d, 3d and 4th level drifts are still being driven north in excellent ore, and we understand that the shaft will soon be started for the 5th level. The ore house is full of first-class mineral that will mill at least $100 per ton, and what is henceforth taken out will be stored away in the mine till spring, when they expect to have 1,000 tons ready for crushing.

THE GLENBROOK.—This mine is developing splendidly. The last crushing paid $36 per ton, and they will have another crushing of 75 tons, between now and Christmas that will pay equally as well.

SILVER CHAD.—This mine is situated on the same mineral belt as the Poorman, and was formerly considered one of the most promising in camp. It was abandoned from mismanagement, rather than from any lack of intrinsic merit. The buildings are all enclosed and the hoisting works will be ready to start up in a few days, when sinking the shaft will immediately be commenced.

SIMONDI & Co. have had the Cosmos mill running on their Oro Fino ore this week.

THE ILLINOIS CENTRAL continues to pan out handsomely.

Arizona.

WEAVER—MINING NEWS.— Arizona *Miner*, Dec. 5: Mr. Stanton has prospected his great Sexton mine well enough to satisfy himself and others of its ability to pay for working, so he has started for San Francisco with the view of procuring a quartz mill, which purpose is good.

Two arrastras were running, in camp, and a gentleman named Reardon was preparing material with the view of erecting two arrastras.

Placer miners, down there, are doing well.

FROM WICKENBURG.—Smith's good ten-stamp mill is doing full night and day duty.

George Monroe and others had started towards Bradshaw, on a prospecting tour.

IN TOWN.—Many pick, pan and shovel patriots were in town yesterday, loading their animals with provisions. Result—a great deal of gold dust in the tin cans of our storekeepers. A good rain would enable hundreds of men to make fair wages in our auriferous creeks and gulches.

Colorado.

SAN JUAN.—*Miner*, Dec. 11: The San Juan fever seems to be abating in this vicinity.

NOTWITHSTANDING the fact that the panic reduced the number of ore buyers, as well as the prices paid, there is, at the present time, no appreciable diminution in the quantity of ore being offered.

POLAR STAR.—The workings of Eldridge & Co. on the Polar Star mine have reached such a depth that windlassing by hand is extremely onerous, and almost impracticable. They are now erecting a horse whim, which will soon be completed, when sinking will be resumed with increased vigor. The mine is largely productive, and has fully proven the fact that with greater depth the value and quantity of ore also materially increases.

Montana.

MINING MATTERS.—*New North West*, Dec. 13: The mining season, now closed, has been the best average one for the miners of Deer Lodge county they have ever had. The long session, the unusual abundance of water through the summer and until the late freeze and the general productiveness of the mines have contributed in a gratifying measure to the prosperity of the country, and the mining element as a class is in a better financial condition than for several preceding years. Business men note cash sales larger, collections easier and money more plentiful than last year—a judgment sustained by the showing of the County Treasurer's collections before the 1st inst., when the additional per cent. is added. Notwithstanding the large entry of lands for patent, no diminution of gold product is noticeable by reason thereof. Very considerable bodies of bar land, not heretofore worked, will next year be mined, and they are of a character that, it is believed, will not only produce largely, but with the methods and appliances purposed, will instigate the occupation and development of thousands of acres of bar lands heretofore passed by as unavailable. It is fair to assume that, with an ordinarily favorable length of season and quantity of water, next year will have fully as prosperous and productive a mining season as the present, and, not unlikely, a better one.

Yosemite Valley.

[Written for the PRESS by J. G. LEMMON.]

The Alcoves.

Leaving our "picturesque rock" and passing on a mile, we find the upper end of the Yosemite picture gallery receding into three deep alcoves—the better to display their several studies.

Entering the north alcove about a mile, a most charming and sublime perspective is before us. The limpid mirror lake—*Ah-wy'-ya*—in the foreground reflects with startling distinctness the great domes on either side, and beyond is a partial view of Cloud's Rest and other peaks with the silvery North Fork of the Merced, fed by snow drifts, winding down by their bases and debouching into the lake. Of the domes before mentioned as embossing the head of the valley, the lowest one is

North Dome—To-coy-ae.

The summit of this beautiful dome is 3,775 feet above the valley, only 195 feet less than three-fourths of a mile, and only 106 feet less than Mt. Diablo, the most noted peak, from its central position, in California, and in sight of two-thirds of its population. Its shape is described by the Indian name *To-coy-ae*, meaning "shade to Indian baby basket." This, the highest point yet described, reaches up to the region once swept by icebergs, and its bald, rounded crown is a record of the world forming laws in their vigorous action in the ages long past. Opposite, across lake *Ah-wy'-ya*, is the famous

South Dome—Tis'-sa-ack.

This magnificent object is so lofty, so conspicuous and so singular, that it is the cynosure of all eyes at Yosemite and the loved theme of tourists. It has been split through vertically and robbed of its north half, which crumbling to pieces forms the dam of the lake below, but the remaining half, a clean cut hemisphere, towers up 6,000 feet above the valley; 720 feet more than a mile and 10,000 feet or nearly two miles above the sea.

From time immemorial this colossal demilune has been regarded with veneration by the natives, for it was the throne of *Tis'-sa-ack*, the beautiful "goddess of the valley," beloved of *Tu-tock-ah-nu'-la*, the great chief who had his throne on the wondrous bluff, the gate post, at the opposite end of the valley. The legend is very beautiful, when fully related, but must be shorn of its ornaments by condensation here.

Legend of Tis'-sa-ack and Tu-tock-ah-nu'-la.

In the good old days when the sky touched the earth, the children of the sun dwelt in Yosemite. All was lovely for *Tu-tock-ah-nu'-la*, their great Sachem, being neither a member of Congress, a railroad contractor nor a chief of the Tammany ring, attended to the wants of his people. Leaving his gorgeous throne daily, he herded the deer and ran them down into the valley, and often roused up a grizzly for them to hunt. His smile caused the flowers to spring up in great beauty, but his sighs for a companion, a royal-blooded Mahala, lodged the pine trees. He prayed to the Great Spirit for his people, and the rain descended to nourish the corn, the gentle winds shook the acorns out of the oaks, and grasshoppers were found on every patriarch's table. He also added a petition for a wife. One evening, as he happened to look eastward, he saw one of Joaquin Miller's yellow-haired maidens sitting on the South Dome—then a complete rotunda. She was transcendently beautiful, dressed in fashionable attire, and was certainly divine, for from her shoulders depended radiant white wings. Throwing him a kiss and pronouncing his name in dulcet tones, she gathered up her Dolly Varden and fled over the dome. The fascinated chief pursued, being no scrub in a race, but the Y. M. passed the string too lengths ahead. Time—2:13¾. This fastest time on record would have been excelled by "*Tu-tock*," but for the down from "*Tis'*" wings which the angel shook into his eyes. He yelled "foul!" but the judge, a rival Mona chief, would not hear him. "*Tu-tock*" became excited. Every evening, for an entire moon, the fleet maiden repeated her taunt, and the race was renewed. In the meantime the interests of *Tu-tock-ah-nu'-la's* people suffered. The leaves of the corn rolled up, the acorns remained shrivelled in their cups, and the song of the grasshopper was unheard in all the valley.

One morning, after an unusually hard night's race, *Tis'-sa-ack* returned to her perch, and looking down, beheld the plight of the neglected people. She repented her coquettishness, and a great pity rose up in her heart. She knelt upon the smooth dome and besought the Great Spirit to send again the rain for the nourishing corn, the wind for the toothsome acorns, and blades of grass for the delicious grasshopper. With an awful sound the dome split open; water poured out, and flowing down, formed first the lake; a reservoir kept back by the shattered rock, then coursed through the valley, reviving the corn and grass; a rushing wind coming through the gorge shook down showers of plump acorns, and with a chorus of chirpings the grasshoppers crawled out of their retreats to nibble the sprouting grass. But the lovely, yellow-haired, angel-winged maiden for whom the people had suffered, and by whom they were rescued from starvation, vanished, never to be seen again. But in memory of her deed of pity there shines the glorious Half-Dome; beneath it reposes Mirror Lake, and bordering all the water courses of the valley are thousands of beautiful white violets, born of the down of *Tis'-sa-ack's* wings, lost in her tantalizing flight from the desperate *Tu-tock-ah-nu'-la*.

Retreating from the North Alcove we cross over again and enter the deep South Alcove a mile and a half. This is occupied by the single study—the beautiful

South Fork Fall—Tu-lool'-wy-ack.

This cataract is 600 feet high and as it terminates a rapid and plunges sidewise over the precipice it presents a novel and interesting appearance. It is 100 feet more than twice as high and much more interesting than the falls of Montmorenci in Canada—a greatly celebrated cascade.

Retreating again to middle ground we confront the central, very high and elaborate Alcove. Entering through the screen of forest trees about half a mile, a roar of many waters warns us that a larger, more stupendous cataract than any we have seen is near. The scene opens grandly; nothing ever chosen by an artist is more striking for a center piece to the foreground of a landscape, than a magnificent water-fall. When this can be fringed with noble pines and framed with towering, frowning mountains, the picture is well nigh complete. Add to this a glittering cascade leading to a background which is a repetition of the first, but with every object projected on a vastly larger scale, with a cloud-flecked sky, pierced by snow-helmeted peaks, the study may justly be regarded as the culmination of artistic effect—and such is the Central Alcove of the Yosemite gallery.

The thundering, flashing, vaulting centerpiece is

Vernal Falls.—Pi'-wy-ack.

This fall is terrible. The volume of water—the main Merced—is so great that is is not entirely comminuted by the wind, but continues in a corving column of whitening, glittering diamonds thrown over the rock wall into a yawning gulf 250 feet below. This appearance is exactly described by the Indian name *Pi'-wy-ack*, meaning "Shower of Sparkling Crystals." Though but a tithe as great in volume, this cataract is 50 feet higher than the Great Shoshone Fall in Idaho. Behind it is a curious rock-shelved cave, lined with mosses, ferns and lichens, and beside it a series of long ladders and platforms leading up to the rock balustrade running out to the edge of the rapid where it begins the awful plunge. The original Architect—aided by human enterprise—has also contributed a bridle trail, rough and zigzag, but finally triumphant, around this fall, and leading back to other grander scenes in a loftier, more extended region.

Just above Pi'-wy-ack, the river spreads out over a flat, descending rock-floor forming a still, glistening, swift-darting cascade 60 feet wide, called "Spangled Apron;" and a quarter of a mile farther it comes rushing noisely through a crooked, rocky, steep gorge called "Diamond Flume." Above the Flume and half a mile from Pi'-wy-ack, a tumultuous roar, a glittering cloud of spray, and a shining shower of rockets shooting out from the sky tell where pours the matchless

Nevada Fall—Yo-wy'-ke.

This, the largest, grandest, last to be described fall in Yosemite, is also one of the highest and most celebrated for grandeur in the world. It is formed artificially in part, by obstructing with rocks and trees, a cut-off from the main Merced, confining it with the rest of the river, joined at this point by another large stream, and, all together, plunging head-long over a mountain side 700 feet high! —just twice as far as the lately discovered Victoria Falls in South Africa, and 40 feet more than four times as high as the great Niagara, but, of course, infinitely less in volume than either.

This cataract is awfully sublime—past description. Its Indian name, *Yo-wy'-ye*, "Meandering," refers to the grand sweep of the side-long curve striking near the bottom against the inclined rock, giving it a new direction and forming a folding, shimmering, spray-wreathed curtain, 130 feet wide.

Nature's Flower Gardens.

Near the base of this fall—as in all the other falls of Yosemite, but intentionally omitted in their description — is a mound or spreading mass of soil or mould, found on one side of the the stream, in the direction of the greatest descent of spray, and covered with luxuriant grass, flowers and shrubbery, its projecting rocks draped with rare and beautiful mosses, and all constantly saturated with the nourishing spray. The grass patches of the *Pi'-wy-ack* and *Yo-wy'-ye* cataracts approach the dimensions of meadows, being fifteen or twenty acres in extent. Their gigantic and rare vegetation affords a paradise to botanists, but to explore their treasures involves the necessity of wading knee-deep through the dense wet grass, sinking ankle-deep in the sticky mud, and taking the chances of being momentarily enveloped in a bewildering series of raining cloud-spray, quickly saturating your clothing, unless protected by water-proof over-garments, but compensating for the annoyance by affording, if the afternoon sun is shining, the most brilliant double rainbows, in a complete circle about you,—the Hindoo type of the Deity.

The arrangement of the cataracts in this Alcove resembles the disposition of the loftier cataracts in the great Yosemite landscape before described, but the connecting cascade river here is three times longer, and the volume of water perhaps, is four times as large. Heightening the effect of these greater cataracts, is added the more stupendous mountains enclosing them. The one on the south or right side of the Alcove is an immense mass of stratified granite, clothed with a forest of evergreens. On the left opposite the highest fall rises in solemn grandeur the naked

Cap of Liberty—Mah'-tah.

This swelling, sloping, smooth-worn, cloud-wreathed rock is 2,000 feet above *Yo-wy'-ye* thundering at its base, 5,000 feet above the floor of Yosemite valley, and 9,000 feet above the sea. It resembles in slope the symbolic cap which artists represent on the scepter held by the Goddess of Liberty; and by common consent, but against the ambition of certain tourists, is called "Cap of Liberty." It is rounded like the domes described in the North Alcove, for, like them, it rises into the region once swept by crushing icebergs. The Indian name *Mah'-tah*—"Suicide," is pertinent as relating to their traditions, but the legend must be omitted.

For sky ornaments to the cusnoy of the Central Alcove there rise in the dim distance the snow-striped spires of the culminating peaks of the Sierras, with the perfect dome of Starr King—*Se-wah-lam*, reposing grandly in the foreground and connecting them to earth.

The peak is easiest approached by the zigzag stair case, but otherwise smooth trail above the falls, and also the one commanding the most extensive bird's-eye view of Yosemite is on the left, back of "Cap of Liberty" and the "South Half Dome," and is poetically named

Cloud's Rest.

We can ride almost to the very summit of this commanding peak, and here, at an elevation of 10,500 feet or almost two miles, the scene is one of the most interesting anywhere presented in the wonderful Sierras. This summit remains a sharp, rugged comb of granite—for it is above the level of glacial action which rounded lesser peaks and smoothed the base of this. The same phenomenon is observed in all the higher peaks beyond—smooth bases with bristling, often beetling crowns.

What a scene of splendor and magnificence is presented on every hand! First let us try to realize our own great height, which so enables us to command an accurate view of greater ones.

The summit of Cloud's Rest, beautifully carpeted with flowers, but with banks of snow striping its north side, was determined by Professors Whitney and Hoffman, just the day before our visit, to be 6,500 feet above Yosemite valley, and 10,500 feet above the sea. This is but 77 feet less than the perpetually snow-draped and much celebrated Lassen's Peak, and much higher than Spanish, Pilot, Alturas, Table Rock, Saddle Back, Downieville Buttes, Pyramid, Castle Job's, or any other peak between Lassen in Shasta county, and Silver Peak in Alpine county, only 50 miles north of our position.

The Higher Peaks

Northward, near at hand are Mt. Hoffman, 10,872 feet, and Catbedral Peak, 11,000 feet high. Southward the Starr King dome, 9,600, Clark's Peak, 10,000, and Gothic Peak, 10,850 feet. Eastward are the culminating peaks of Lyell, 12,270; Castle, 12,500, and 40 miles away, but towering distinctly to view, the chief over all—Mt. Dana, 13,227 feet or very nearly two and one-third miles high!

River Sources.

That we are in the midst of a group of the loftiest peaks of the Sierras is indicated also by a glance at the map. Within a few miles of our position and compassed in a day's ride, a person may visit the headwaters of five of the principal rivers of this coast. Northward flows the Tuolumne, with its wonderful newly-discovered *Hetch-Hetchy* cañon. Northeastward the Walker river sinking into the Great Basin. Southeastward Owen's river, running into Owen's lake, and southwestward King's river emptying into Tulare lake, and westward the San Joaquin entering finally San Francisco Bay.

EMBALMING AT VIENNA.—In the Exhibition there were several specimens of the embalming of parts of the human body. Those exhibited by Dr. Marini, of Naples, were particularly to be noted. One of these was a large round table made of muscles, sinews, etc., of a dark brown color, with a handsome polish. This practioner is reported to have been specially successful. Among his other exploits he petrified Thalberg, and the widow is said to keep the corpse in her drawing room. He also embalmed Mazzini, and so well that some of the more economical admirers of that statesman, urged that the body should be set up in Rome as a statue, and thus save expense. The London *Chemist and Druggist* remarks that a petrified collection of kings, queens, philanthropists, murderers, poets, etc., would be a capital speculation to start in London, and would leave Madame Tussand's wax-works hopelessly behind.

Water Tanks and Health.

San Francisco depends principally for its water supply on the Spring Valley Water Company's Works. The water from this source is introduced into houses in two different methods. The first is by direct communication between the main pipes and the emission faucets in the houses. The water is thus supplied entirely by direct pressure from the head of the reservoir. But in many parts of the city this pressure is too great for the convenience of consumers. Another method of introduction is accordingly extensively resorted to. In order to moderate the force of the stream, tanks are built on the tops of houses. These receive the water from the street mains, and it is thence conducted through the houses by the usual pipes. To regulate the supply in tanks and prevent overflow, an ingenious device is used, which quite fulfils its purpose, but is open to a serious objection from a hygienic point of view, viz., that in interrupting the free and constant flow of fresh water from the receivers, it creates a little lake of stagnant water on every house-top where it is employed. The water is detained in the tank by not being steadily drawn out and exposed to the rays of the sun for indefinite periods of time, and all the organic operations of vegetable and animal germination and decomposition have the same opportunity to occur as in stagnant pools. Months, sometimes years, elapse, and no thought is given to cleaning and sanifying the tanks. These remarks are equally as applicable to those larger tanks in the Mission plain, which are elevated the air and filled from wells by the aid of windmills. In these latter the water often remains for a long while, for the owners are induced to economize the water in order to maintain their supply, when during the summer season there is often quite a length of time in which the wind does not blow strong enough to work the windmill.

Attention has, at different times, been called to these facts by physicians, and also to the danger of generating disease which ensues. Housekeepers do not, however, appear to have been sufficiently warned to induce them to take steps to obviate the difficulty. Following is a portion of a paper on "Water Tanks on the Tops of Houses," which was recently read by Arthur B. Stout, M. D, member of the State Board of Health, before the San Francisco Microscopical Society. It deserves the attention of all who are interested in the matter:

It not unfrequently happens that these house-top tanks are inaccessible, except at considerable trouble and expense, and are not supplied with covers. Housekeepers, who otherwise would be careful, are consequently deterred from taking the proper precautions to sanify their tanks. Persons unacquainted with these facts, and finding the water impure would be disposed to inculpate the reservoir of the Spring Valley Water Company; when in truth the noxious swamp is on the roof of their own houses.

The question of the purity of water, and strictly careful analysis of the various ingredients which the analytic chemist can detect, are from time to time urged upon the public, doubtfully appreciative of the scientific skill displayed; but let any housekeeper, not too lazy to take the trouble, enter a search into the contents of the tank on his house roof; let him collect a bottle full of its soil, and put one drop of it under a proper microscope, and then pronounce—having seen it with his own eyes —upon the soup which he drinks.

Many observers know that these house-top tanks are the birth-place of mosquitoes, like many other swamps, only on a smaller scale, and that their offspring migrate into the apartments below them; that various devices of window screens and mosquito nets are resorted to, and that one house will be infested while adjacent ones will be exempt—and yet, the hint of the mosquito, truly piquant, fails to awake them to the quality of their beverage.

The water when first drawn from the tank may appear clear and pure, but in a short time it becomes cloudy, emits a faint odor and soon turns to a greenish color. After a time green vegetable matter forms, some of which floats on the surface and also gathers on the bottom of the containing vessel. This vegetable growth now becomes the nidus or homestead of innumerable microscopic animalcules of many different species. In due time these plant and animal creations die and decompose, adding thereby another noxious ingredient to the water. Air and water for human use should be pure, or nearly so. Anything short of purity is an incentive to gastric disorder and unfavorable digestion. We may not be able to specify with precision if all these vegetable and animal products are actually poisonous when taken into the stomach; nor yet how far the heat of the organ may destroy them, and the gastric juice assimilate them like other vegetable and animal food, but we do know that such infected water, when drank, produces nausea very promptly. The stomach revolts and indicates to the mind that something unhealthy has been swallowed. We also know that certain of them escape destruction in the stomach and are absorbed into the blood, and give rise to toxæmia. It is not our object here to discuss these questions, but accepting the well-admitted fact that water under the above conditions is unwholesome, to show that these tanks, when neglected, are the prolific generators of septic fevers and other diseases of anæmic type not necessarily, febrile.

Useful Information.

A Perfect Water Proof.

A writer in an English paper says: By the way, speaking of water proofs, I think I can give travelers a valuable hint or two. For many years I have worn India rubber water proofs, but will buy no more, for I have learned that Scottish tweed can be made entirely impervious to rain, and, moreover, I have learned how to make it so; and for the benefit of readers I will give the recipe:

In a bucket of soft water put half a pound of sugar of lead, and half a pound of powdered alum; stir this, at intervals, until it becomes clear, then pour it off into another bucket, and put the garment therein, and let it be in for twenty-four hours, and then hang it up to dry without wringing it. Two of my party—a lady and a gentleman—have worn garments thus treated, in the wildest storms of wind and rain, without getting wet. The rain hangs upon the cloth in globules. In short, they are really water proof. The gentleman, a fortnight ago, walked nine miles in a storm of rain and wind, such as you rarely see in the South; and when he slipped off his overcoat, his under clothes were as dry as when he put them on. This is, I think, a secret worth knowing; for cloth, if it can be made to keep out wet, is, in every way, better than what we know as water proofs.

Consumption of Timber in Ties.—Estimating the railways of the United States as equal, including sidings, double tracks, etc., to 60,000 miles of single track, the aggregate number of ties would be 150,000,000, at the rate of 2,500 to the mile. This, says a recent circular of the Lumbermen of Pennsylvania, requires the timber from twelve and a half acres of well-timbered lands to furnish, because the average of trees from which railroad ties can be cut will not exceed forty to the acre, nor can there be cut more than five ties from each of these forty trees. The average life of a railroad tie is said to be about five years—consequently, 30,000,000 are requisite for repairs annually, and to furnish this amount will consume 2,500,000 acres of best timber land. In addition to this vast area, about 500,000 acres are required annually to supply ties for the new roads which are being constructed each year. The circular referred to has been sent to lumber dealers and consumers through the State, calling attention to the condition of the lumber interests. It appears from this that the amount of pine lumber annually cut on the Susquehanna river and its tributaries exceeds 500,000,000 feet. Should this amount be cut for the next five years it would amount to 2,500,000,000 feet. A careful estimate has been made of the area of timber lands, and the average yield of lumber per acre, and the alarming conclusion is reached that three years', stocking at the present rate of 500,000,000 feet per year would entirely exhaust all the pine lumber now standing. These statements are made after very careful estimates, and with the endorsement of the most experienced lumberers in the State.

Softening Ash Timber.—Steam is the usual agent, but where practicable, boiling in water is the very best means. The great thing is to have the right quality of ash; some kinds will bend and some won't. One locality will yield prime ash, another close by, with equally good soil, will yield inferior. The timber should be heavy, tough, and cut from a good butt; no matter if three years cut and seasoned. A splinter from this quality of ash will peel or pull off toughly, and run a long way down the plank before it gives way. Half an hour's boiling will soften two inches square. Then have everything ready. Oat with your stuff, from the boiler to the mold, and screw or wedge it up without stopping, and leave it to cool for a few hours.—*Cabinet Maker*,

Preservation of Hair for the Hatter.—A method of treating animal hair for the use of the hatter, which has been kept secret for a long time, is now known to consist in the application of a solution of the nitrate of mercury for the purpose of preventing the putrefaction of the fiber. This substance, however, is very deleterious, both to the health of the workmen and to the implements of the trade, and recently carbolic acid, or creosote has been used to great advantage as a substitute. This has the property, not only of preserving the animal matter, but of causing the hairs to contract, thus rendering them more apt to felt. The subsequent treatment of the fiber is according to the usual process, and the carbolic acid may be added to the oleaginous or astringent elements used by hatters.

New Process for Cleaning Pictures.—It is well-known that it is very difficult to remove the old varnish from pictures without injuring the delicate lines beneath. The new system consists in simply spreading a coating of copaiba balsam on the old painting, and then keeping it face downward over a dish of the same size filled with cold alcohol, at an altitude of about three feet. The vapors of the liquid impart to the copaiba a degree of semi-fluidity, in which state it easily amalgamates with the varnish it covers. Thus the original brilliancy and transparency are regained without injuring the oil-painting. After the picture has been hung up for two or three days, it looks as if it had just been varnished afresh.

To test the Purity of Atmosphere.—First, a simple method of ascertaining the presence of impurity (carbonic acid) in the atmosphere, is to nearly fill a glass tumbler with lime-water, and to place it in any convenient position, as on the mantle-piece of a room. The rapidity with which a pellicle forms on its surface, or the water becomes cloudy, corresponds to the amount of the carbonic acid present in the atmosphere that surrounds it. Second, a little moist carbonate of lead put on a plate or saucer, and exposed in the same way, will turn black, should any sulphureted hydrogen be contained in the air. This is a very delicate test for that destructive gas.

Protection of Iron from Rust.—The following mixture is stated to be an excellent brown coating for protecting iron and steel from rust: Dissolve two parts crystalized chloride of iron, two parts chloride of antimony, and one part tannin, in four parts water, and apply with a sponge or rag, and let dry. Then another coat of the paint is applied, and again another, if necessary until the color becomes as dark as desired. When dry, it is washed with water, allowed to dry again, and the surface polished with boiled linseed oil. The chloride of antimony must be as nearly neutral as possible.—*Engineer*.

A New Method of Coloring Leather.—By an invention recently patented, leather, and other substances used in hats, are claimed to be colored, elegantly and cheaply. Logwood is employed to give the materials a ground color, and the dyeing is further conducted by the use of aniline. The ground color is applied with starch, and by the addition of supplementary colors, a peculiar softened clouding or spotting of the colors is effected, the result being something like that seen in marbled paper used in book binding.

Domestic Economy.

How To Cook Potatoes.

There is probably no daily food which is capable of yielding us such a variety of healthful and tasteful dishes as the potato; and yet many respectable families seem to have but one mode through the entire year and that with as little care as possible—namely, boiling. Some might be interested to notice a few of the pretty ways in which I have seen them prepared in a pleasant rural home, where the mistress does not think it beneath her to give some time and thought to the planning of nutritious and even fanciful dishes.

Do you say, "a potato is only a potato when you have done and said it all?" Ah! my dear Mrs. B., I agree with you exactly—a potato is only a potato, but as long as they are made a standard dish on almost every table, is it not better to give the preparation of them a little study and care, rather than bring them in to dinner cold, wet and indigestible? So while our brothers and husbands are pondering over the kind best adapted to the climate and soil, let us give a few minutes to the nice preparation of the fine crop they will put into our cellars by and by.

Care should be taken to select from the bins all alike in size, being sure to allow them just sufficient time to become nicely crisp and brown at the hour the remainder of the dinner is ready. They should not be allowed in the open oven the moment after "done," there to shrink, as if protesting against delay; neither to be sent to the table to wait five or ten minutes the movements of some tardy husband and children. Mashed potatoes that are nicely pared, boiled and dried, seasoned richly with salt, cream, or milk and butter, are always good, always nice, if smoothed down into the dish with care, and prettily spotted with pepper. The mashed potatoes left from dinner make a fancy dish for breakfast by making into little cakes, or patties, with the hand, and frying brown in dripping or batter. The butter should be hot when the cakes are put in.

The boiled potatoes, left after yesterday's dinner, are very good chopped fine and warmed for breakfast in good milk and butter, with salt and pepper. When you are boiling your tea-kettle to-night, you can boil half a-dozen good-sized potatoes, and when cold slice them the long way, something less than a quarter of an inch in thickness. In the morning lay them one by one on the griddle, to slowly toast or brown in good butter or fat, salting them carefully and evenly, after placing them in a covered dish. Gentlemen always like these with their coffee; and these, or the potato balls, are an addition to the tea-table when gentlemen are present. Still another way to fry is to pare the potato round and round, like an apple, until all is used, cooking slowly and evenly in a covered "spider," until brown.

In the spring, when the potatoes are poor, difficulty is experienced in preparing them to relish. Pare and cut them half an inch in thickness, putting to boil in salted water until tender; then pour off the water and put on cream, or good milk, seasoning and thickening carefully with only a little flour. For those who have no milk, fresh boiling water can be used with nearly as good results. But I am outstretching my limits. For, a little aside, nearly all housekeepers know the value of potatoes in yeast, and that grated they make an excellent pudding with the usual additions. After all, perhaps, there is no form which is used, both for excellence and health, equal to the good old-fashiond mashed potato.—*Country Gentleman*.

Dress of Our Extremities.

During the damp and cold season, says Dio Lewis, deficient dress of the feet and legs is a fruitful source of disease. The head, throat and liver are, perhaps, the most frequent sufferers. The legs and feet are far from the central part of the body. They are not in great mass, like the trunk, but extended and enveloped by the atmosphere. Besides, they are near the damp, cold earth. For these and other reasons they require extra covering. If we would secure the highest physiological conditions, we must give our extremities more dress than the body. We wear upon our legs in the coldest season but two thicknesses of cloth. The body has at least six. Women put on them four thicknesses under the shawl which, with the various doublings, furnishes several more; then, over all, thick padded furs, while their legs have one thickness of cotton, under a balloon. They constantly come to me about their headache, palpitation of the heart, and congestion of the liver. Recently one said to me, "All my blood is in my head and chest. My head goes humpety-bump, my heart goes humpety-bump."

I asked, "How are your feet?" "Chunks of ice," she replied. I said to her, "If you so dress your legs and feet that the blood can't get down into them, where can it go? It can't go out visiting; it must stay in the system somewhere. Of course the chest and head must have an excessive quantity. So they go 'humpety-bump,' and so they must go, until you dress your legs and feet in such a way that they shall get their share of blood." In the coldest season of the year I leave Boston for a bit of a tour before the lyceums—going as far as Philadelphia, and riding much in the night, without an overcoat; but I give my legs two or three times their usual dress. During the coldest weather men may wear, in addition to their usual drawers, a pair of chamois-skin drawers with great advantage. When we ride in a sleigh, or in the cars, where do we suffer? In our legs, of course. Give me warm legs and feet, and I'll hardly thank you for an overcoat.

My dear madam, have you a headache, a sore throat, palpitation of the heart, congestion of the liver, or indigestion? Wear one, two or three pairs of warm, woolen stocking, and thick, warm shoes, with more or less reduction in the amount of dress about your body, and you will obtain the same relief permanently that you would derive temporarily from a warm foot bath.

I must not forget to say that a thin layer of India rubber cement upon the boot sole will do much to keep the bottom of the feet dry and warm.

Good Health.

Catching Cold.

Catching cold is "as easy as lying," but to explain the pathology thereof is by no means so readily done. In fact, until the recent researches of Dr. Rosenthal, whose work on the subject is attracting much notice in Europe, almost nothing was known about it except the mere fact that the ailments popularly ascribed to "cold" are liable to occur after the body, or some part of it, has been suddenly chilled, that is, cooled below the normal temperature. There are two factors concerned in this chilling process; the nature of the external medium—such as air or water—in contact with the body; and the condition of the blood-vessels.

Dry air has very little power to abstract heat, if it be still; but a slight wind from the constant contact of fresh particles of cold air on the surface of the body, soon carries off its heat. If there is much moisture in the air it greatly increases its power of abstracting heat, and when wind and moisture are combined, the chilling effect reaches its maximum. Experience has shown that it not so much the absolute lowness of temperature which gives rise to colds, as sudden changes from a higher to a lower. The reason of this was not understood until Dr. Rosenthal explained it. When the surface of a healthy animal is exposed to cold the cutaneous vessels contract, and by thus confining the blood to the interior of the body, prevent its cooling, and preserve the temperature of the vital organs, unless the application of cold be continued for a considerable time. This is not the case, however, when the animal has been previously exposed to warmth. The cutaneous vessels become paralyzed by the heat, and remain dilated even after the cold has been applied. The blood is thus exposed over a large surface and becomes rapidly cooled, even though the temperature of the surrounding medium is not very low.

In Rosenthal's experiments, animals were kept at a temperature from about 97° to 104° F. The temperature of the animals themselves quickly rose during their confinement to 111° or 113°. After their removal it not only sank to the normal temperature but even below it, so that an animal which was from 108° to 111° in the warming apparatus fell to 96.8°, and remained at that for several days, although the room in which it was kept was moderately warm. Confinement in a close office, hot theater, or crowded ball-room, will have a similar effect on man. From such places people pass out into the cool open air, or sometimes even purposely station themselves in a draught. The blood, which is coursing through the dilated vessels of every part of the surface, is rapidly cooled, and on its return to the internal organs, cools them much more quickly than it could have done had the person simply been exposed to cold without dilatation of the vessels by previous warmth. Rosenthal lays much stress on the great effect of sudden *cooling* in bringing on a cold, the sudden change in the temperature of the blood producing an irritating effect, and inducing inflammation in any weak organ in a way that a gradual alteration would not do. It would seem, however, that the alteration must be made from a temperature above to one below the normal temperature of the blood, and not a mere reduction from one considerably above the normal to one at or near it.

When much heated we may stand for a short time in a cool atmosphere with impunity; but if we stand long enough to produce a shiver, we run a great risk of catching cold. The fact that it is more dangerous to sit for a long than a short time in wet clothes, appears to indicate that a considerable and more gradual cooling, such as may then occur, will produce similar effects to a slight cooling suddenly effected by exposure to a cold draught after having been in a warm room. The effect of a chill in causing inflammations may be partly due to the effect of cold on the tissues themselves, and partly to the congestion which will occur in some parts when the blood is driven out of others by the contraction of their vessels. Rosenthal is inclined to ascribe the chief power to the former cause. Everybody knows the beneficial affect of cold baths, cold sponging, etc., in "hardening" persons, as it is termed, so that they are able to face almost any weather, and to endure sudden changes of temperature without injury. Rosenthal considers that the frequent application of cold water or cool air increases the tone of the cutaneous vessels, so that they do not become so much relaxed by heat as to be unable to contract with sufficient force when necessary. The power of regulating the temperature is thus preserved, and the person prevented from catching cold.—*Boston Journal of Chemistry*.

Regular Eating.

Half of all ordinary diseases, says Dr. Hall in his *Journal of Health*, would be banished from civilized life, and dyspepsia become almost unknown, if everybody would eat but thrice a day at regular times, and not an atom between meals, the intervals being not less than five hours, that being the time required to digest a full meal and pass it out of the stomach.

If a person eats between meals, the process of digestion of the food already in the stomach is arrested, until the last which has been eaten is brought into the condition of the former meal; just as, if water is boiling and ice is put in, the whole ceases to boil until the ice has been melted and brought to the boiling point, and then the whole boils together.

But it is a law of nature that all food begins to decay, after exposure to heat and moisture for a certain time. If a meal is eaten, and in two hours another, the whole remains undigested for seven hours, before which time the rottening process commences, and the man has his stomach full of carrion—the very idea of which is horribly disgusting.

As, then, all the food in the stomach is in a state of fermentive decay, it becomes unfit for the purposes of nutrition and for making good, pure blood. Small wonder is it that dyspeptics have such a variety of symptoms, and aches and complaints in every part of the system, for there is not one drop of pure blood in the whole body; hence, the nerves, which feed on this impure and imperfect blood, are not properly nourished and, as a consequence, become diseased. They "complain"; they are hungry—and like a hungry man—are peevish, fretful, restless. We call it nervousness, and no one ever knew a dyspeptic who was not restless, fretful, fidgety, and essentially disagreeable, fitful and uncertain.

The stomach is made up of a number of muscles, all of which are brought into requisition in the process of digestion. But no muscle can work always. The busy heart is in a state of perfect repose for one third of its time. The eye can work twice in a second, but this could not be continued five minutes. The hands and feet must have rest, and so with the muscles of the stomach; they only can rest when there is no work for them to do—no food in the stomach to digest. Even at five hours' interval, and eating thrice a day, they are kept constantly at work from breakfast until the last meal is disposed of, usually ten o'clock at night. But multitudes eat heartily within an hour of bed time; thus, while the other portions of the body are at rest; the stomach is kept laboring until almost daylight, and made to begin again at breakfast time. No wonder is it that the stomach is worn out—has lost its power of action. Many girls become dyspeptic before they are out of their teens, in consequence of being about the house and nibbling at everything they lay their eyes on that is good to eat.

Glycerine in Subcutaneous Injections.—Dr. Constantin Paul recommends glycerine as a dissolvent for subcutaneous injections. He considers it to be far superior to water, alcohol, etc.; it is neutral, can be kept easily, and is, of all liquids, the one which approaches the nearest to the composition of subcutaneous cellular tissue.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. H. STRONG.
W. B. EWER, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.50; three months, $1.25. Olube of ten names or more, $3 each per annum. $5, in advance, will pay for 1½ year. Remittances by registered letters or P. O. orders at our risk.

TABLE OF CONTENTS.

GENERAL EDITORIALS. — Palmer's Power Spring Hammer; California Gravel Mines, 401. Close of Volume; A Profitable Mine—The Idaho; Agassiz Memorial Meeting, 408. Howard's Automatic Car Coupling; Camp Floyd Mining Company, 409. Notices of Recent Patents, 404.

ILLUSTRATIONS.—Palmer's Power Spring Hammer, 401. Howard's Automatic Car Coupling, 409.

CORRESPONDENCE.—The Origin of Veins and Formation of Mineral Lodes; Julian and Banner Districts, 402.

MECHANICAL PROGRESS.—Aluminum as a Material for Balloons; New Churn; The Tunnel between England and France; Anthon's Sewer-Gas Trap; A Wonderful Agricultural Machine; Another Perpetual Motion, 403.

SCIENTIFIC PROGRESS. — On Atmospheric Ozone; Coating Fabrics with Tin; Flooding the Sahara; A Step Forward, 403.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 404.

MINING SUMMARY from various counties in California, Nevada, Arizona, Colorado and Montana, 405.

USEFUL INFORMATION. — A Perfect Water Proof; Consumption of Timber in Ties; Softening Ash Timber; Preservation of Hair for the Hatter; New Process for Cleaning Pictures; To Test the Purity of Atmosphere; Protection of Iron from Rust; A New Method of Coloring Leather, 407.

DOMESTIC ECONOMY. — How to Cook Potatoes; Dress of our Extremities, 407.

GOOD HEALTH.—Catching Cold; Regular Eating; Glycerine in Subcutaneous Injections, 407.

MISCELLANEOUS.—The Meadow Valley Company's Mill; Amador Canal; Consumption of Horse-Flesh in France; The Kearsing Mill, 402. Yosemite Valley; Embalming at Vienna; Water Tanks and Health, 406. The Hunt & Douglass Process; Do Insects Devour Lead? Ancient Timber; A Famous Armor; The San Juan Country; A Remarkable Phenomenon; Sharp Practice of Mining Partners; Troy District, 410. The Hoosac Tunnel, 411.

Close of the Volume.

With this issue we conclude Volume XXVII. of the MINING AND SCIENTIFIC PRESS. We devote considerable space in this number to a copious index of the volume, which will prove of great convenience to all who file the paper. It is a gratifying fact to know that a large portion of our subscribers preserve the PRESS, with a view of having them bound for future reference. This is evidenced by the large number of file holders we have disposed of this year. Advertisers will recognize in this fact an important advantage to be obtained in our columns over those of papers which are thrown aside as soon as read.

The past year has been a very successful one in mining affairs on this coast. The important developments on the Cometock, the new districts discovered, the increased interest in California gravel mines, the large dividends paid and the capital invested, have caused more attention to be turned to mining interests then perhaps ever before. Our journal devotes the larger portion of its space to mining matters, and increases in prosperity with mining interests. A glance at the index on the last page will give the casual reader an idea of the detail with which we have paid attention to mining matters. All the new and improved appliances worthy of note have been illustrated and described. New discoveries have been noted carefully, and we have taken great pains to inform ourselves and our readers of the merits and demerits of new districts, and are confident that our efforts in this line alone have saved our readers many dollars.

Our mining summary gives all the important news concerning the different localities in California, Nevada, Utah, Colorado, Idaho, Montana, Arizona, Oregon, Washington Territory, New Mexico, and is carefully compiled weekly from the columns of journals published in the immediate vicinity of the mines mentioned. The mining stock department of the PRESS is attended to with care, and gives our readers in the interior ample information on this subject. The Mining Shareholders' Directory, which is carefully corrected and published in every issue, gives a complete list of mining assessments, dividends, meetings to be held, etc., and is valuable as a means of reference to all interested in mining operations.

New processes of all kinds, of interest to our readers, are described in detail, and the discussions carried on in our columns by practical and professional men on such subjects are more than worth the price of subscription. The discussion as to the working of quicksilver, and that about the Bear River Tunnel, are the prominent ones of this volume.

We obtain all the names of officers of different mining companies, as they are elected from time to time, and publish the list of new incorporations every week. In fact, everything of interest to the mining community that can be collated appears in our columns. In this particular field we are alone, there being no other paper devoted to this special interest published on this coast.

We expect next year to be more profitable for the miners than any that has passed, and no one who is at all interested in the pursuit can afford to be without the PRESS. The commencement of a new year is a good time to send in new subscriptions, and we expect to add many more names to our already large list of subscribers. Our paper has been running 14 years, and is established on a firm basis, with a permanent subscription list and an increasing circulation. We shall endeavor during the coming year, as before, to merit the continued support of our many patrons.

A Profitable Mine—The Idaho.

The Idaho mine, Grass Valley, is a prominent California mine, which is not quoted on the Stock Board list, but owes its prominence to its bullion-producing and dividend-paying capacity. It has paid regular monthly dividends for several years, having disbursed to stockholders some $1,284,950, of which $682,000 was paid this year. The entire receipts of the mine have been $2,311,437, of which 1,010,612 was the product of 1873.

The Secretary's report, which is published in full in the Grass Valley *Union*, together with the report of the President, shows in detail the operations of the fiscal year, ending Dec. 1st, 1873. That the operations have been successful, can be seen from the fact that $682,000 have been divided among stockholders after expenses were paid. As trouble was anticipated from an adjoining location, the company bought out the interests of the Schofield Mining Company for $25,000, which perfects their title to all the claim. The developments in depth in the mine seem to indicate that they may reasonably expect the mine to last many years with good returns.

The old shaft has been abandoned and the new one is completed to the 700-foot level, 35 feet toward the 800-foot level, not being yet of the full size. The 400-foot east level is in 765 feet from the shaft, of which 368 feet are through pay ground, and the last 397 feet are through barren ground, with a small stringer most of the distance. The 600-foot east drift are worked up to the 500-foot level, 210 feet from the shaft, thus enabling them to form that level in worked-out ground for that distance, and the quartz is all standing between the 400-foot level and 500-foot level.

During the year they have worked 27,624¾ tons of rock, of which 8,605½ tons came from the 400-foot level; 11,481⅛ from the 600-foot level; 6,937¾ from the 700-foot level. This gave a gross yield of

66,210.80 ounces bullion	$979,969.39
212½ tons of sulphurets	28,318.00
25 tons on hand est'd	3,000.00
Specimens	364.50
Tailings	12,950.00
Total	$1,024,691.89

Giving an average of $37.91⅛ per ton. During the year they ran 1,012 feet of drift and completed 329 feet of shaft. The machinery is all in good working order.

The superintendent gives the following as the receipts and disbursements:

Disbursements.

Mill and mining	$232,847 44
Saving sulphurets	2,908 00
Prospecting in 400	3,124 00
New shaft	22,792 00
Blacksmith shop	1,263 49
Construction account	8,096 67
Water works	3,602 46
Extension of ditch to Scott Flat	8,738 84
General account	41,612 00
Total	$324,984 80

Receipts.

Cash on hand from last settlement	$ 6,669 70
Proceeds from bullion	979,950 39
Sale of sulphurets	23,119 00
Sale of specimens	364 60
Percentage from tailings	5,265 83
Total	$1,008,708 12
Pan rent	$ 907 00
Water	436 00
Old material	511 08
Total	$1,904 08
Total receipts	$1,017,281 90
Total expenditure including dividends	1,006,984 80
Cash on hand	$10,297 10

The milling and mining account in the disbursements is interesting; it is as follows:

Surface Labor	$ 41,654 59
Underground Labor	119,036 24
Wood, poles and lagging	23,314 21
Powder and fuse	3,795 00
Hardware	10,233 18
Lumber	3,091 77
Candles and oil	4,680 13
Coal	2,006 37
Quicksilver	2,941 41
Foundry	10,046 60
Drill steel	1,106 36
Water	1,463 50
Superintendent's salary	6,000 00
Sundries	3,679 08
Total	$232,847 44
Average cost of milling and mining, $8 61½ per ton.	
Saving 237½ tons of sulphurets	$2,908 00
Prospecting 397 feet in barren ground in 400 level	$ 3,124 00

In sinking the new shaft the sum of $14,046 was expended for underground labor, and $3,329 for surface labor. The labor on the water works cost $1,147, and the labor on the extension of the ditch to Scott Flat was at an expense of $5,828,

The secretary's report shows the receipts and disbursements, not only for the year, but for each fiscal year beginning in 1869. The total receipts for the year ending Dec. 1st, 1873, were $1,010,612.20, to which the balance on hand Dec. 2d, 1873, being added, shows the total assets to have been $1,017,281.90.

The total expenses for the year, including the dividends, were $1,006,984.80, and balance in the Treasury is $10,297.10.

The dividends for the year amount to 220 per per cent. on the capital stock, and aggregate $682,000. The dividends of January, February and March, were 15 per cent., or $46,500 each. Those of April, May and June, were 20 per cent., or $62,000. That of July was 25 per cent., or $77,500. Those of August, September and October, were 20 per cent., or $62,000; and those of November and December were 15 per cent., or $46,500.

This is a very fine showing, and the aggregate receipts and expenditures of the company for the past five fiscal years, are still more interesting. The receipts from all sources were as follows:

1869	$306,038.75
1870	183,450.23
1871	407,301.16
1872	404,036.52
1873	1,010,612.20
Receipts for five years	$2,311,437.86

Dividends have been as follows:

1869, 11 div. or 66 per cent	$170,500.00
1870, 8 " " 12 " "	37,200.00
1871, 12 " " 76 " "	232,500.00
1872, 11 " " 62½ " "	162,750.00
1873, 12 " " 220 " "	682,000.00
Total	$1,284,950.00

This shows that 53 dividends have been paid in five years, aggregating 414½ per cent. of capital stock, and amounting to the sum of $1,284,950. What mine can make a better showing than that, and who says that California quartz mines are played out?

INDIAN DEPREDATIONS.—The Trustees of the Walnut Grove mining company of Arizona have petitioned Congress for $300,000, which they say they have lost by Apache depredations. We hope they may get their $300,000, but think that if every one who was damaged financially by the Indians in Arizona, should obtain a money compensation therefor, the taxes would increase. If these Indians were exterminated the mining interests of Arizona would become more prominent, and the country would be rapidly settled up.

THE Lady Bryan mine near Virginia has been purchased by a company in this city for $50,000 and they have incorporated. There are 6,000 feet in the lode. Machinery will be put up and the mine put in good running order.

THE annual meeting of the California Academy of Sciences will be held at their rooms on the evening of January 5th, when the election of officers will take place.

THE course of lectures to be delivered by the Professors of the State University will commence on the evening of January 3d.

Agassiz Memorial Meeting.

The Agassiz Memorial Meeting of the California Academy of Sciences, held in Mercantile Library Hall on Monday evening last, was very well attended, showing how deeply even the general public feels the loss of the distinguished scientist. The exercises consisted of addresses by members of the Academy. The rostrum and the portrait of Agassiz in the rear were draped in mourning. The platform was occupied by Professor Davidson, President of the Academy; President Gilman, of the State University; Professor Le Conte, Professor Carr, General Hewston, Mr. Dall, and Rev. Doctors Scott and Stebbins.

President Davidson opened the proceedings with an address of considerable length, from which we make a few extracts:

In his own handwriting, upon a souvenir of his Pacific Coast visit, is the legend, "L. Agassiz, born May 28, 1807." On the 14th of December, 1873, the telegraph flashed to the uttermost parts of the earth that he was no more, and we meet to-night to render homage to his memory. After a few occasional meetings, from my first acquaintance with him, thirty-seven years since, it happened to my lot last season to introduce him to the Academy after his voyage of twenty-two thousand miles, undertaken at a time of life when most of us look forward to rest from life's toiling. You saw that his old enthusiasm was still ablaze. You felt the peculiar charm of his presence and voice, and were happier and better in knowing that you had come into personal relations with one who commanded such influence and power for good. So it had been through a busy, earnest life, devoted to but one object; to see him was to love him; to know him was to willingly promise service to science for all time, and to feel amply repaid in fulfilling the promise. Learned men and statesmen, educated and brilliant women had hung on his words, and had paid the same tribute—all mourn with the same sorrow. In our hearts he cannot be forgotten; in the centuries hence, his influence and labors will assure students there were intellectual giants in those days. Simplicity and purity of character, singleness of purpose, directness and comprehensiveness of the highest order, were the bases for that subtle power which gathered facts from observation, combined and correlated them, and thence deduced order. Words of praise can add nothing to his fame; but we can honor his memory by imitating his fervid devotion to science; it never faltered; it pervaded his being. He was the incarnation of science, and greater love hath no man than this. He laid his life down for it.

It seems a marvel how much of the enthusiasm and industry of Agassiz has been developed among those who have studied or come in contact with him. If there were any that became weary with the heat and the burthen of the day, they have dropped by the wayside: but the young, the earnest, the ambitious are scattered over the globe, searching, working, studying to increase our knowledge. He impressed them that their real student life but just commences when they leave their college halls."

I close with a few words of a power which he possessed, so unusual among scientific men, yet so absolutely necessary for the development of science as understood by the specialists, and of knowledge as taught by the collegee, that we can pray without ceasing that his mantle may fall and cover many shoulders. Others possess it, perhaps differing only in degree, or the magnificent endowments which have been made to our higher seats of learning would have been diverted to other purposes. Yet he first made the claims of science a demand upon the affluent who had grown wealthy through practical applications of scientific investigations and discoveries. He would admit of no compromise measure. He boldly stood forth as the champion of the self-sacrificing devotees of science; for the benefit of human knowledge he had given with unsparing prodigality the mental and physical activity of a life noted for its remarkable vigor, endurance and consecutiveness; and his sense of justice was aroused to appeal for help from those who could so easily and so largely endow our colleges and universities, our museums and academies of science. You have listened to those appeals, and know that even in our midst they have not been in vain. Throughout the country the leaven has reached the bank accounts of large-minded men who, during their lifetime, wish to see the fruition of their noble instincts. In the last ten years millions of dollars have been devoted to learning and science; but many more millions are needed, and the apostles of science must cease not to urge and prove her claims. The interest which he imparted to science on this coast in one short visit has steadily increased; the cheering words he spoke in our behalf have fallen upon the hearts of our people and awakened their sympathy. The Academy certainly has cause to rejoice in its benefactions; but we need still more freely the helping hand of endowment to realize what he prophsied.

We can listen no more to the magic of his voice, but his example is ever before us. He has gone, but his name will be a landmark in human knowledge through the long roll of centuries.

The address of President Gilman dwelt more particularly upon the character of Agassiz as a

teecher and the infinence he exerted upon Americen edncation:

The name of Agassiz does not belong to the learned alone, though it is honored most by the wise and the profound; it likewise belongs to the common people, for it is a household word throughout the land.

Few men while they live, attain renown among the multitude, and also retain their eminence among philosophers; but he wore fitly this double crown—"The praise of praised men," which is gold, and the applause of the unlearned, which is silver. How few of those whom we call distinguished, whether writers, teachers, statesmen, merchants, scholars, or leaders in arms, are equally known and honored with this college professor, this comparative zoölogist, this interpreter of natnre! The news of his decease has brought to learned societies, and to common schools, to universities, and to fishermen's cottages, the sense of a personal bereavement, for it tells of the loss of a guide, the death of a friend.

When such a man departs, old, honored, unsullied and beloved, it is well to inquire into the antecedents of his character, the elements of his renown. It is not every teacher who is endowed with a good constitution, neither too nervous, nor too phlegmatic. Agassiz was fortunate in his physical character, his noble figure, his beaming countenance, his elastic step, his excellent health. He was not of that type of scholars whose shriveled faces, and whose withered forms declare the neglect of exercise and the misuse of food; nor was he one who gained by stimulant extraordinary force. He possessed what might be called a commending presence, favorable personal equation, a magnetic influence, a manly beauty, or an easy dignity—a quality not to be defined, but everywhere appreciated, which may be inyet hred, must be first in-born

His early culture was most liberal. In many countries, and through many years, his studies were prolonged. Four years, the record runs, in the gymnasium at Brienne, two years in college at Lausanne, two years in medical school at Zurich, five years in the universities of Heidelberg, Munich and Erlangen; thirteen years, at least, of preparation in the period youth.

Thus he came in contact with some of the most renowned teachers in Europe—Cuvier, Hamboldt, Martius, Spix, and a host besides—and received that intellectual impress from superior minds, which is far more influential than a library full of books, or a city full of museums.

Hence he laid a broad basis for his Scholarship. Ancient and Modern Languages, Philosophy under Schelling, Humen Anatomy and Physiology, Botany, Minerology and Zoölogy were all pursued with such enthusiasm that, in any of these departments, he might have been distinguished.

So was he qualified for work—by natural endowments, personal presence, honorable ancestry, narrow circumstances, prolonged culture, and broad foundations. What, now, were the consequents of such antecedents—the superstructure on such a foundation?

There was supreme kindliness or self-control in his disposition, which led him to be patient with ignorance, and what is harder yet, with arrogence; which made him generous in bestowing his time, his learning and his letters upon others, which made him accessible to the most timid student, and the most humble discoverer of a cnrious thg.

To this was added a charming enthusiesm, which gushed forth in no spasmodic intermittance, but bubbled up perpetnelly with refreshing effervescence. He captivated all whom he met. He made them believe that his work was his play; that they too might engage in it, with a surety of reward. He seemed to say perpetually to his associates, as Feraday said to Tyndall, under untoward circumstances: "Our subjects are so glorious, that to work at them rejoices and encourages the feeblest, delights and enchants the strongest."

Genuine gratitude was also conspicuous in all he did. The school-boy who brought him an uncommon fish, or the farmer who sent him a nest of turtle's eggs, or the woodsmen who favored him with a family of little rattlesnakes, was as sure of his hearty acknowledgement as the millionaire of Boston who endowed his museum, or the tobacconist of New York who bought for him Penikese Island, or the officers of the Government who placed at his command the resources of the Coast Survey. No Emperor or King ever received such homege, voluntarily bestowed by high and low alike, or such tributes from the united realm of earth, and air, and sea; none retnru such gratitude. This gratitude was marked by numistakable sincerity.

There was, moreover, a hearty co-operation with other workers, and in other spheres—a friendly indorsement of their effort, which was free from the tone of patronage or of interference. The members of this Academy must well remember the generous words which he uttered on the evening when he first set foot in San Francisco—his congratulations at the success of the Academy, his words of encouragement for the University, and his eulogy of the Geological Survey, the pride of all the science of the State.

Still more remarkable in Agassiz was his readiness to aid in the diffusion of knowledge. Devoted as he was to scientific researches—to the advancement of learning, by investigations of the most profound sort, extending down to the lowest organisms at the bottom of the sea, and back to the remotest æons of geological history, he was always ready to come before the public and bring the newest and the best of his acquisitions. There are such men as intellectual misers, but he was not of that race. There are also those who are deaf and dumb, but he used all his faculties. He did not wait for costly diagrams or extraordinary specimens. A blackboard and a piece of chalk were all the apparatus which he required for a lecture on Natural History. At the oldest University in Cambridge, or at the newest in Ithaca, through the *Atlantic Monthly* or the extra *Tribune*, in the National Academy, or on Penikese Island, in the State-House at Boston, or in Pacific Hall at San Francisco, he was ready to teach all who wished to be taught. The wisest would enjoy the clearness, the liveliness, and the method with which he told his tale; and the uninformed would think they were growing wise because they could follow so agreeably and intelligently the utterance of a master. He believed in the public schools; and one of the last acts of his public life was to give a lecture at a teachers' meeting.

Professor Joseph Le Conte then treated of the scientific work of Professor Agassiz, and the results of his labors, delivering an interesting and able address.

Professor Carr then read a eulogy in the form of a letter addressed to the Academy, from R. E. C. Stearns, who was unable to be present.

Rev. Dr. Stebbins then made a brief but interesting address and was followed by Rev. Dr. Scott.

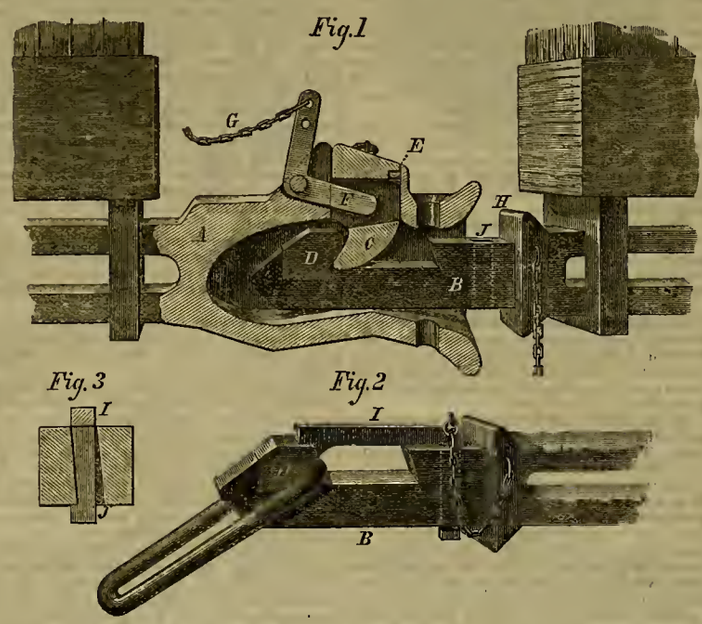
A series of memorial resolutions were then read and the Secretary instructed to forward an engrossed copy to the family of the deceased. Altogether, the exercises were very appropriate and interesting, and the attendance showed the feeling of the community in regard to the death of the illustrious scientist.

Howard's Automatic Car Coupling.

Among the many forms of automatic car couplings in use, is one patented in September of this year, by Franklin E. Howard, of Genesee, Livingston county, N. Y., which, while it connects the cars automatically as they are brought together, allows of the uncoupling of the cars from either their tops or sides.

The device is claimed to operate perfectly on the sharpest curves and steepest grades, and to bring the cars as closely together as the ordinary drawheads now used. It is attached to the carriages in the usual manner, with perhaps somewhat more up and-down and sideways play.

From Fig. 1 the construction will be readily perceived. *A*, is the drawhead of one car, made with a cavity of sufficient size to receive the connecting drawhead, *B*. Fitting into a recess in *A*, so that its lower and hook-shaped end may project down into the hollow portion, is a steel coupling block, *C*, which engages with another steel block, *D*, dovetailed and bolted to the drawhead, *B*. The block, *C*, is provided with a ring or handle at its upper portion to admit of its being readily lifted ont by hand, when it is so desired, to unconple the cars, while its movement is limited by a pin or screw, *E*, working in a suitable groove on its surface. When raised, the coupling block, *C*, may be held up by a pin placed in a hole therein and above the drawhead.



HOWARD'S AUTOMATIC CAR COUPLING.

Pivoted in a slot in the upper part of the letter is a bent lever, *F*, of which the forward arm enters a slot in the coupling block, so that, by snitably operating the lever, said coupling block may be easily lifted up, and the cars thus uncoupled. This is effected by a chain, *G*, attached to the upright arm which, passing under a suitable roller, connects with one lever near the top of the car with two other levers attached to the sides of the vehicle.

The draw-bar, *B*, has a collar, *H*, to prevent its being forced too far into the opposite drawhead when the cars are brought together.

A point claimed as of considerable advantage in the invention is the facility with which it may be adapted to connect with and in the same manner as the common form of drawhead. In the forward part of the bumper, *A*, is a hole for a coupling pin which secures one end of the link. The other extremity of the letter slips over the coupling block, *D*, where it is held in place by a square angle bar, *I*. One portion of this bar drops into a square though somewhat inclined hole in the drawhead, *B*, at *J*, and its lower extremity, being notched, locks itself in. This will be more clearly understood from the section shown in Fig. 3. The horizontal portion of the bar, *I*, simply rests along the top of the drawhead, *B*, and terminates in an end angle to fit the corner of the block, *D*, thus securely confining the link.

The Camp Floyd Mining Company.

The Camp Floyd Mining Co. (Limited,) which has been for some time under a cloud, is making a good showing through the efforts of the Resident Manager, Mr. Henry Sewell. This gentleman has been for the past five months energetically at work in bringing the affairs of the company to a satisfactory paying basis. Though he has had up hill work he has not received a cent from London, where the property is owned, and has succeeded in paying some $2,500 worth of liabilities of the former management. He personally lent the company about $8,000 until the new capital could be raised.

During this time 500 tons of custom ore hee been milled and $51,000 in bullion produced, on which a cash profit of about $7,000 was made, and $9,000 in tailings. Mr. Sewell is now expecting about $60,000 as fresh working capital and will then be able to extend milling operations.

In connection with this subject the prices paid for ores by the Camp Floyd mill will he interesting to mill men. They are as follows:

Ore assaying 40 dollars per ton, 25 per cent.
Ore assaying 50 dollars per ton, 30 per cent.
Ore assaying 60 dollars per ton, 35 per cent.
Ore assaying 70 dollars per ton, 40 per cent.
Ore assaying 80 dollars per ton, 43 per cent.
Ore assaying 90 dollars per ton, 46 per cent.
Ore assaying 105 dollars per ton, 50 per cent.
Ore assaying 130 dollars per ton, 57 per cent.
Ore assaying 150 dollars per t n, 60 per cent.
Ore assaying 175 dollars per ton, 63 per cent.
Ore assaying 200 dollars per ton, 65 per cent.
Ore assaying 225 dollars per ton, 67 per cent.
Ore assaying 250 dollars per ton, 68 per cent.
Ore assaying 300 dollars per ton, 73 per cent.
Ore assaying 350 dollars per ton, 74 per cent.
Ore assaying 400 dollars per ton, 75 per cent.
Ore assaying 500 dollars per ton, 78 per cent.
Ore assaying 600 dollars per ton, 80 per cent.
And upwards.

The assays are guaranteed to correspond with those of the U. S. Mint, and ores can be sampled by battery or crusher at the option of the shipper. Mr. Sewell, publishes in the Salt Lake *Tribune* a communication in which he speaks of the success of the company and says:

"For valuable services during the trying past I have to thank the First National Bank for the kindness and confidence it has reposed in me, in coming forward on several occasions, as Mr. Hussey has done, during the worst part of the financial crisis, with sums varying from $6,000 to $8,000, for the purchase of ore; in consequence all the bullion from this mill has been consigned to the First National Bank, and forwarded by Mr. Hussey to New York. I have also to thank that gentleman for supplying the mill, up to date, with about 400 tons of ore from the Sunnyside mine, and for his continued patronage in that respect, as ores from that mine continue to be shipped daily. Before Christmas some $25,000 more of bullion will he consigned to that bank. When the new capital of the Camp Floyd mining company arrives, we shall he in a position to return past favors, and I am glad to mention in this connection that two of the principal properties which the new Camp Floyd company will try to acquire, now belong to Mr. W. Hussey.

I have also to thank Mr. James Baxter, our Superintendent, for the great zeal, activity and intelligence which he has displayed in the management of the company's mill, which has greatly contributed to our permanent success.

We are very glad to see that the affairs of the company are in a more satisfactory condition, and that a profit will ho realized on their investment. Utah mines are in the shade just now on account of the many swindling transactions carried on by unscrupulous trickstors, who had their own welfare and not those of the mining interests at heart. People here and in England had almost begun to think that honesty and Utah mining could not go hand in hand, and the Territory has suffered accordingly. The success of only a few of the properties held in the English market, will do much to dissipate those ideas and inspire confidence in mining property. With competent and honest managers and a due regard for the interests of the company, not individuals, many of the mines now behind a cloud, will no doubt come into the sunshine again.

We notice in the *Tribune* of the 21st, that the mill at Camp Floyd is working satisfactorily, and that a complimentary testimonial to Mr. Sewell has been gotten up, thanking him for his energy, skill and perserverance in "bringing on" the mining interests of that district, and has been universally signed by the residents of Lowiston and the surrounding country. Three bars of high grade silver bullion from the Sunnyside and Lion Hill mines, Camp Floyd, are on exhibition this week at Salt Lake City.

Telegraphy in the Mines.—We have been shown by Mr. Heenen, telegraph operator, the recently arrived materials and apparatus for the construction and equipment of a system of telegraphic signals in the Manhattan shaft. A gong 8 inches in diameter which was made to Mr. Heeneu's order in Cleveland, Ohio, will he mounted on an oiled walnut base in the engine room and will be worked on what is called the "open circuit" instead of the closed, as is usual, the return wire instead of going into the earth being returned to the gong. The length of the line will be 800 feet and its construction will be commenced as soon as Mr. Curtis returns from San Francisco. When completed, it will be a great convenience, enabling the miners not only to direct the engineer as to desired movements of the cage but by a system of signals to communicate as to what supplies are needed below. The entire apparatus is of the best and most expensive quality, the greater part of it having been made expressly to Mr. Heenan's order.—*Reese River Reveille.*

A Battle Mountain paper is informed that the White and Shiloh mine at Galena, has been bonded to an English company for half a million of dollars. Parties are negotiating for the Trenton, and other parties for the Butte, in the same district.

The ore body recently struck in the famous and much abused Emma mine, is said to be one of the most extensive yet discovered in the mine. The Emma may yet regain her former reputation.

The Boston Gas Company charged a citizen $18 for gas consumed at a time when he had not a burner in his house.

It is estimated that the value of wheat and flour shipped from San Francisco this year, foots up $25,000,000.

The Hunt and Douglass Process.

The following letter on the Regenerative (Hunt & Donglass) Process of extracting copper from its ores, as carried on in Chili, recently appeared in the London *Mining Journal*:

Thie method, which can be adopted at any mine, is applicable to all classes of copper ores, whether they contain snlphur or not. The only difference consists in the fact that ores containing sulphur must be calcined first. Even native copper, if it is present only in minute quantities, will he fonnd to he dissolved. This method offers the following advantages over all others that have been proposed by the wet process.

1. In its application no acid or salt is nsed to dissolve the copper. In the ordinary wet processes tho oxidised copper is dissolved in hydrochloric or sulphuric acid, or the ore is calcined with 2 or 3 tons of salt to each ton of copper. In this method (Duglass and Hunt's) the solvent employed is the protochloride of iron (neutral), which is contiuually regenerated by the act of precipitation, with ouly a very trifling loss.

2. Less than half the qnantity of metallic iron is reqnired to precipitate the copper than is necessary in acidnlated solntions.

3. The only operation in which fuel is used is in the cslcination of the metals, and only a very small qnantity of this. So that this method is applicable, with great advantage, to those places of the glohe where the low ley of the ores, or the high price of fuel, would render smelting impossihle or unprofitable. The ley of the copper which is obtained hy this process being about 90 per cent., the cost of rsdncing it to bar copper is almost insignificant.

Details of the Operation.

Grinding the Ores.—The character of the base of the mineral determines the extent to which the grinding must be carried. If, for example, the specks of metal are very finely distributed in an impermeable hase, it is eviduut we must grind them as fine as possible, because if the ore is a sulphurous one, the ahove-mentioned specks of metal can he thus calcined perfectly, and also he exposed with facility to the action of the chloride of iron in the dissolving bath. But if the copper in the ore is of considerable quantity and size, the calcinatiou does not reqnire such an extreme grade of fineness to become effective. We must, however, hear in mind that if we do not grind the ores sufficiently fine onr consumption of fuel during calcination will be considerably greater. In other words, the consumption of fuel is in inverse ratio to the coarseness of the powder to he calcined. With regard to ores found in Chili, we may ohserve that sulphnrets extracted from *vetas*, or veins, ought to he passed throngh a sieve of 8 to 12 holes to the inch, while those extracted from *mantas*, or patches, ought to be ground finer still. To grind the ore to the first state it is best to use cylinders, and for the last state of pulverisation stamps will he fonnd the most economical. A pair of 28-in. cylinders ought to grind one ton of ore in the hour, with a power of six horses, and each stamp ought to powder about 2¼ quintals in one hour, supposing that the ore has been previously ground np in an ordinary Blake's crusher. Each stamp generally requires 1-horse power. Speaking generally, we may state that carbonates do not require the same degree of fiueness as sulphurets.

2. *Calcining.*—As I have already said, we mnet calcine the sulphurete, an operation which, when they have been pnlverized, can he dous at the rate of 200 quintals in 24 hours. If the metsl is in coarse powder it is hetter to use a mechanical furnace, but whether the metal is coarse or fine, we esn nse the ordinary reverberating frrnace, taking care to keep up a low heat, and to frequently stir up the charge. In the case of certain classes of ore very rich in sulphnr, calcination in heaps in the open air heforehand is very advantageous, inasmuch as this operation facilitates in a very high degree its subsequent complete pnlverisation, and also considerahly diminishes the cost of cslcining iu the furnace. The object of this calcining is to convert the snlphnrets of oopper into oxides and snlphates: the very last trace of sulphur will disappear if the operation be condncted with care, and in this case the copper will be completely extracted in the eubsequent operations. Such an exact resnlt is very difficult to obtaiu unless with skilled workmen. However, without very great expenditnre of coal, and with ordinary care, not more than one-half, or at most one per cent., will he lost, which will be afterwards arrested in the re-washings.

3. *The Solution.*—The solvent used ia the protochloride neutral of irou. This can be manufactured by mixiug common salt aud snlphate of iron in certain proportions. By dissolving metallic iron rich in sulphur a considerable portion of copper is converted iuto snlphate, which is aoluble in water; now, if for every 60 lbs. of copper dissolved in this manner there are added 120 lbs. of oommon salt, and the liqnid treated with metallic irou, the copper will be precipitated, and there will be formed in the solution such a quantity of protochloride of iron, that it will be only necessary to add 200 lbs. more of common aalt, and aufficient water to form a bath of 100 gallons of the reqnired strength. This solveut can be applied to all oxidised metals, whether they are subseqnently placed in the filtering haths, or whether, through containing exceedingly finely divided mineral, they are treated with an "agitator."

It often happens that the coarse powder (granza) of the carbonates is very friable. It is better in this case to separate the coarse powder from the fine, which always contains and indeed constitutes, the friableness; after this separation has been effected the coarse is worked by the filtering method, and the fine in a bath by means of an "agitator."

These haths may be of wood or of brick. A oonvenient size for wooden baths is 12 ft. in diameter and 3 or 4 ft. in depth: 3-inch American pine answers well for this purpose, with iron bands of 3 by 3-8th inches.

The filter can he made in various methods. We may place in the bottom of the butt a layer of stones 3 inches thick, or ashes, or clean coke, with a covering on top of sand. Or we may make the filter with a false bottom, with holes in it, protected by common sacks. The metal is placed on the top of the filter, to the thickness of 1 or 2 ft., according to its fineness of division. In case we nse brick tanks, the bricks must be of a close texture, well fastened with good Roman cement, and faced with the same material.

The liquid will run out by a hole placed at the bottom of the bath or tank, which must be always kept covered up, to prevent loss of heat. It is advantageous to damp the mineral before throwing it into the bath, as this promotes the uniform percolation of the solution. We must be careful to prevent the formation of a depression in the bed of the metal, and take care that there always remains 3 or 4 in. of liquid on top. To obtain this result it will be sufficient to go on replacing with fresh liquid that which runs out at the hottom of the bath. When the liquid which flows out at the bottom ouly contains copper in minute proportion, the exhausted bath is washed to extract the salt eolution. This water serves over and over again to replace the iron and salt which were lost in the original bath—iu other words, to regenerate the hath; 24 honrs are snfficient for the extraction of copper from ores of 5 per cent., always supposing that the solution is of sufficient strength and the bath is maintained at a temperature of 50° centigrade.

Iu a hath of the above-mentioned capacity, with an "agitator," four or five hours are sufficient to dissolve the copper coutained in 5 tons of 5 per cent. metal, inasmuch as the "agitator" effects the extraction very much quicker than filtration only.

The solution of the chloride of iron works npon the oxides of copper, converting them partly into protochlorides and partly into dichlorides of copper, giving room, at the same time, for the formation of peroxide of iron, and a very smsll quantity of oxi-chloride. When the copper is obtained hy filtration only, by excluding the air as much as possible, the prodnction of suh-chloride of copper is augmented, and that of oxi-chloride of iron diminished, and a very notable saving of iron is obtained in the precipitation of the copper.

In the subsequent precipitation, the chloride of iron is returned to the bath with a very small loss. The chloride lost in the basic oxi-chloride, and that which is lost in the re-washings, when this latter operation is imperfectly done, is so small that one qniutal of salt is sufficient to replace the loss in one ton of copper. This loss can be greatly lessened, and, indeed, the loss of iron entirely avoided, by passing a cnrrent of sulphurons acid from the calcining fnrnsce over the top of the bath in the "agitation" baths, or in the ordiuary filtering ones.

When working npon metals that form snlphate of copper in their calcination no loss of iron is experienced: it even may happen that an excess of iron accumnlates in the bath, which can be separated from time to time by mixing small qnantities of chalk with the calcined metal. In the working of carbonates a small loss of chloride of iron is inevitable. To avoid this it is recommended that a small quantity of sulphurets be added to them, hecanse the sulphate formed during the calcination of 1 tou of yellow snlphnrets will replace the loss cansed by the treatment of some numher of tons of carbonates.

Precipitation.—The fluid, charged with copper, which rnns ont of the baths falls iuto a vessel, which has the form of a large rectangle, and the bottom of which is filled with pieces of iron. It has longitudinal divisions, like canals, which compel the flnid to run over a considerable space of ground. The oopper solution goes in at one end, and after having run through all the divisions, at the bottom of which it comes in contact with the iron, is drawn off at the other end by means of a pnmp, and returned to the original bath, the chloride of iron in the hath heing regenerated at the expense of the metallic iron cousumed in the preoipitation.

Materials such as pails, pumps, pipea, &c., ought to be of wood; connecting tnbes, whether for the conducting of steam or for the distribution of fluids from bath to bath, ought to be of gutta percha, inasmuch as the greater part of the common metals and their alloys are attacked by a liquid charged with chloride of copper.

(Method of workiug metals containing gold and silver by the same process). The bath of proto-chloride of iron and salt, after heiug more or less completely saturated with copper, will dissolve chloridised silver, or any of its componnds, by virtue of the well-known action of protochloride of oopper. Repeated experiments have proved that metals of sulphur containing gold and silver in Colorado, United States, and Chili, when duly calcined, leave all the silver contents dissolved in the hath in the shape of chloride, which can be precipitated in the metallic state, by treatiug it with metallic copper, or passing it throngh copper cement. After the silver has been thus passed the copper is precipitated, as usual, by metallic irou. The residue of the bath, after it has thus lost both its silver and its copper, contains all the gold in a state favorable for its removal. The same method is also applicable to copper and silver regulus. Experiments on a large scale have proved that a reguln containing at the same time gold, copper and silver, can be treated by the present system for the extraction of pnre copper, with a very trifling additional cost for the extraction of the gold and silver. To remove the silver we need only make nse of a portion of the copper cement obtained by a previous operation, and for the removal of the gold we can nse either the method of chloridisation or amalgamation.

This method has been tried extensively at Tiltil, and also near Coquimbo, but has hitherto signally failed. A great difficulty was experienced at first in getting the tuhs to stand, hut after this difficnlty was got over the "bath would uot regenerate. A great deal of money was sunk at Tiltil, and no adequate results followed. The process may, then, he condemned practically, though glowing with 25 per ceut. theoretically.

Do Insects Devour Lead?

This curious question is suggested from correspondence to *The London Builder*, in which Mr. John Murray makes the following etatements:

"In stripping old lead flats you will often find the whole under surface much oxidized, and where the boards are much decayed the oxidation is alwaye greatest. I have never found an insect in old lead, nor have I heard or read of one whose digestive orgaus were strong enongh for so tough a morsel. I have often known mice to gnaw a hole through lead-pipe, but you may always find the shavings under their work. Is it not likely to be the acid formed in decomposition of the insects, or their excrement, that has destroyed the lead? I once met with a cistern with a six pound lead hottom, that had not been used for several years. The water that was left in it had evaporated long since; and on the bottom were the dried remains of a nnmber of wiry worms, and theee lay in a perfect bed of oxide of lead, whereas all other parts of the hottom and sides were sound.

"The pin-holes mentioned in lead valleys, etc., are caused by oxidation either from vegetahle or sooty deposit, snd sometimes from dross flaws in the lead, which are sooucst acted upon."

In the following number of the same journal, Mr. Bonel A. Evans attributes the holes in the lead described hy Mr. Murray, to a different cause. He says:

"In making some repairs lately, it became necessary to remove some five pound lead flat, which had heen down ahout thirty-five years; one of the hoards was found *extensively wormeaten and decayed*, also one of the next partially so. Upon examining the lead which covered the decayed wood, it was found full of holes, similar to those in the wood heneath, the other portiou which covered the sound hoards heing perfectly sound.

"I have ehown it to some practical builders, and they say they never came across such a thing. Will you please mention it in your journal, to learn whether such a thing has occurred elsewhere; as, if it is established, it will readily account for the pin-holes pinmhers find in guttering, or other lead work in combinstion with wood-work?"

ANCIENT TIMBER.—Probably the oldest timber in the world which has heen subjected to the use of man, ie that which is fonnd in the ancient temples of Egypt. It is found in connection with stone work, which is known to be at least 4,000 year old. This wood, and the only wood used in the construction of the temples, is in the form of ties, holding the end of one stone to another in its upper snrface. When two blocks were laid in place, it appears that an excavation about an inch deep was made in each hlock, into which an hour glass shaped tie was driven. It is therefore very difficult to force any stone from its position. The ties appear to have been the tamarisk, or chittem wood, of which the ark is said to have been constructed, a sacred tree in ancient Egypt, and now very rarely found in the valley of the Nile. These dove-tailed ties are just as sound now as on the day of their insertion. Although fuelis extremely scarce in that conntry, these bits of wood are not large enough to make it an object with Arabs to heave off layer after layer of heavy stones for so small a prize. Had they been of bone, half the old templea would have been destroyed years ago, ao precions would they have been for various pnrposes—*Manufacturer and Builder.*

A FAMOUS ARMOR. — Hanging ahove the throne of Nadir Shah, at the Vienna Exhibition, is the coat of armor and Persian helmet of Sultan Mourad I Ghazi the first, who established Ottoman rule in Europe, and took up his residence in Adrianople. This armor is doubly interesting, for the great Sultan was killed in it by a Servian youth in the battle of Kossara, whioh destroyed the empire of Dushau. The armor ia of Syrian steel, the rims all of gilt links and open in front, where beantifnlly-worked gold clasps, ornamented with large diamonds, close it over the breast. It is an entire suite, gauntlets iucluded; the armlets are of solid steel, inlaid with gold aud precious stones.

The San Juan Country.

The Denver *World* of the 11th says: The remnant of Lieutenant Marshall's divisiou of the Wheeler topographical party arrived in town yesterday afternoon. They had heen out since the 11th day of June, making a topographical and geological survey of a portion of Conejos county. This portion of the outfit consisted of thirty members and seventy animals. They have had some very hard work, been snowed in several times, and have worked until the snow has driven them out of the country. They all speak highly of the country and say that altogether it is the finest portion of Colorado. In timber and grazing especially it is the *bon terre* of the territory. The mountains are steep and rugged, hut in the valleys of the numerous streams that water the conntry, there exists fine rolling land, well adapted to agricultural purposes, and covered with the finest quality of grass and ahounding in all kinds of berries and wild frnit. The elevation of the Atlantic and Pacific divide, in this portion of the Territory, is very high, and the pass from the head of the Rio Grande to Baker's Park is 13,200 feet high. On one side of this psss there is a peak, towering up from 800 to 1,000 feet higher. This peak is not the highest in the Territory, as there are in the Uncompagre district peaks that will ont-tower anything on the earth. The descent for the first mile after crossing the range, is 2,700 feet; and for tbree miles afterward is 1,500 to 1,600 feet per mile. The valleys of every one of the streams that flow into the San Juan from this divide are the finest in the world, and are very rich in fine grass. They speak very highly of the conntry, and say that it is bonnd to he one of *the* spots of the United States. They will recommence their work next spring as soon as the suow will permit them.

A Remarkable Phenomenon.

In a recent communication to the Vienna Academy, Professor Czermak investigated some curious hypnotic phenomena occurring among the lower animals. More especially, hs examined a phenomenon which has heeu long known—viz., that if a shy hen he caught and held down on the ground for a little while (its strnggling resisted), and if a chalk line he drawn on the gronnd, out from its heak, or in cross direction from its eyes, it will become quite still and helpless, and make no attempt to escape, after the hands are removed. A Jesuit, Kircher, in the seventeenth century, describing this "experimentum mirable," attributed the effect to the influence of the chalk line on the hen's imagination!—for he had previously bound the hen's legs; the bandage, however, heing removed when ths fowl wae reduced to quietness; his explanation was, that the animal mistook the chalk lines for bandages, and supposed itself still hound, though its legs were now free. This was an ahsurd theory, and was disproved hy the fact that the hen might he quieted without having its legs tied.

Prof. Czermark at first thought the chalk lines were qnite nnessential; hut he discovered that they played a very important part. In fact, the essential point appears to be the arresting of the animal's attention hy some object put before its syes. The same effect may he ohtained by holding a finger or glass hall, a candle, etc., before the space betweeu the eyes. The phenomenon is of the nature of those investigated by Braid. Prof. Czermak's paper contains many curions facts on the subject, and will he found in *The Sitzungsbrichte* of the Academy.

SHARP PRACTICE OF MINING PARTNERS.—John D. Cusheon, real estate agent, has filed a complaint in the Nineteenth District Court, against John William Crawford, James G. Maxwell, Thomas B. Prince and George B. Somner to recover a judgment against each of the defendants for $5,000. Cusheon complains that in June, 1872, Maxwell represented that he was the owner of a valusble ditch and water privilege and mines located in Pinmas county. Maxwell uot having the means to improve the property, Cusheon joined with the other defendants in an agreement to pay Maxwell $1,000 each, and to coutribute $4,000 each to a commou fuud for developing the mines. They each contributed $1,538. Cusheon says that he was always anxious to carry out the terms of their agreement, hut, the defendants, uuder a plea that it was necessary to perfect the title, relocated and recorded the property. In this relocation Cusheon's name was left ont in the cold. He uow hrings this action to recover his one-fifth interest.

TROY DISTRICT.—Mr. Davies, manager of the property of the Troy mining company, ou a recent visit to Hamilton, expressed himself as much pleased with the mines there, and is confident in their future. The late storm may somewhat retard operations around the mill, but will not interfere with the working of the mines, as the men are under ground. It affords us much gratification to be ahle to chrouicle the faot of the continned prosperity of the Troy company, and it is our hope, one shared in by all, that the prompt and ready manner in which the busiuess has been performed by the efficient manager, may acorue to the advantage of all interested. No company has expended so much money, and paid their bills so promptly, as has the one in question, and they certainly deserve success.—*White Pine News.*

The Hoosac Tunnel.

A correspondent of the New York *Times* writing from North Adams under dato of November 27th says:

The Hoosac mountain was penetrated this afternoon at 3:15. The last barrier against an uninterrupted passage from one side to the other was completely removed, and a few minutes later the parties which had entered from opposite sides were shaking hands on the western side of the breach.

The Preparations.

The holes for the final blast had been drilled by this morning, and but for the previous determination to allow visitors to witness the operation, the whole thing might have been over at 10 o'clock. But there were persons to arrive from Boston, and the opening was postponed for their benefit. The old workman, who had faced death a thousand times in charging holes with nitro-glycerine, was sent down the central at about 1:30 o'clock, with his long cans of the explosive. All the glycerine for this final blast was carried down the shaft, and that for the west end holes was passed through the hole already drilled. The most dangerous task connected with the work of the tunnel was accomplished, and word was brought up that nothing remained but to connect the wires of the battery. The cage was packed full half a dozen times, and the visitors were speedily dropped down the shaft into the dismal regions below. The hollow echoes of the walls, the dim and flickering lamps, the drip of the water, and the reports of occasional explosions where the workmen were engaged in trimming east of the shaft, were the only sights and sounds

The Blast.

Word was at once dispatched to the man who had charge of the blast to connect the wires. This man was stationed only about 500 feet from the heading, and from the effect at our distant station, 2,000 feet from the blast, the crash when the wires touched must have been terrific. The report of the explosion came first with a distinct crack, followed instantly by a dull, prolonged boom, and accompanied by a very perceptible puff of wind. A shout was given by all present, and the company began to flock forward toward the heading in a general scramble, but this was soon stopped, for it would have been highly dangerous to have gone into the heading before it was known whether all the explosives had been discharged. A few hundred feet from the shaft, therefore, the visitors were stopped until two men, who had gone up to examine the holes, came running back with the information that a fine, clean breach had been made. Then there was another pell-mell scramble for the opening.

The Breach.

The breach made was about five feet by four, large enough for two people to pass abreast quite easily. The explosion on the west side was much louder than on the other, and had a great effect on persons in the tunnel. The work done was tremendous. One great rock, weighing fully a ton, was thrown a distance of 300 feet, where its momentum was still sufficient to break down the ponderous gates set up as a barrier.

The Later Work Done.

The western half of the tunnel differs greatly from the eastern half in the headings of the rock. It is nearly all quartz for upward of a mile, and then the material grows gradually softer, until at a distance of 2,000 feet from the portal it gets so soft that it was necessary to brick it the whole distance where it has been completed. Not less than 7,000,000 bricks will have been used in arching. The west end differs from the eastern half, also, in the amount of water; for almost the whole distance of twelve thousand feet the floor of the tunnel is composed of slimy mud, ground down by the feet of the mules and miners, while through the whole length runs a considerable stream of water. The contractors, Messrs. Shanly, have used in the five years they have been at work up to to-day, 275,000 pounds of nitro-glycerine, 312,000 pounds of common powder, 48,500 pounds of giant powder, and 3,500 pounds of dualin, making in all nearly 650,000 pounds of explosives. Forty-three persons have been killed in and about the tunnel, of whom twenty-one met their deaths by premature explosions, four by explosions of nitro-glycerine magazines, nine by falling down the central shaft, eight by rock falling from the roof and similar accidents, and one by drowning. There is some quiet rejoicing to-night in the town of Adams, but no demonstration.

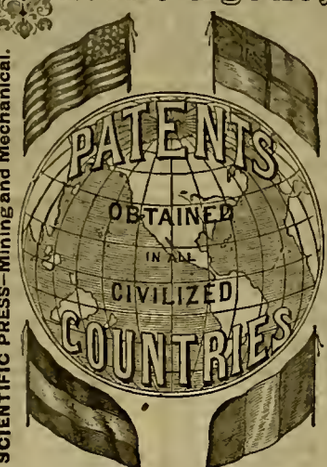
The Work Done on the Tunnel.

One may form such an opinion as one pleases, about the probable satisfaction or otherwise of the high hopes entertained by some that the tunnel is to divert a large share of the Western business from New York to Boston; but in any case it must be admitted that the Hoosac Tunnel is one of the greatest engineering works of the age—second, as a tunnel, only to that at Mount Cenis. If I am correct in a rough calculation, the total amount of rock removed by blasting, in the entire work, will not be very far from 512,000 cubic yards, or an amount sufficient to make a cubic pile of perfectly solid masonry with a side of 225 feet. It has cost, principal and interest, more than ten million dollars, and it is already fifteen years since work was begun, though the enterprise has not been prosecuted from the first, nor always energetically prosecuted when it was in progress.

The tunnel has a length of 25,031 feet. Its dimensions are 24 feet in width and 20 feet in hight above the railroad track when laid, with a central covered drain two feet square. Its form is a rough semi-circle, the variation being such as to give greater hight at the sides than could be given by a true semi-circle. There is a shaft 12,837 feet from the east, and 12,194 feet from the west end, with a conjugate diameter of 27 feet, and a transverse diameter of 15 feet, this shaft being 1,036 feet in depth. Owing to the poor character of the rock near the west end, there is a shaft about half a mile from the end, and 315 feet deep, through which most of the work of this section has been done.

DEWEY & CO'S
SCIENTIFIC PRESS
Patent Agency.

SCIENTIFIC PRESS—Mining and Mechanical.



PACIFIC RURAL PRESS—Agricultural.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an Illustration or a description in the Mining and Scientific Press. We transact every branch of Patent business, and obtain Patents in *all civilized countries*. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Advice and Circulars free.

DEWEY & CO.,
Publishers, Patent Agents, and Engravers,
No. 338 Montgomery st., San Francisco, Cal.

HINTS FOR INVENTORS. We will send on receipt of stamp for postage, FREE, our 52-page Circulars containing 112 Illustrated Mechanical Movements; a digest of PATENT LAWS; information how to obtain patents, and about the rights and privileges of inventors, and patentees; list of Government fees, practical hints, etc., etc. Address DEWEY & CO., Publishers and Patent Agents, San Francisco.

Information Wanted of Ezra S. Gaver.
When heard from last, ten years ago, was at Pikes Peak, Colorado. Any information of him, or his fate, will be thankfully received by his brother, JOHN GAVER, at 1309 Vallejo street, San Francisco.

BUSINESS EDUCATION HEALD'S GOOD INSTRUCTION
BRYANT & STRATTON
BUSINESS COLLEGE
OPEN TO ALL 24 POST ST. SAN FRANCISCO SEND FOR CIRCULARS

The object of this school is to impart a thorough education in business affairs. It is open to persons of both sexes and of all ages. There is an English Department for those not sufficiently advanced for the Business Course. Sessions continue day and evening throughout the year. Students can enter at any time. All wishing to be successful should secure a practical education at this College. Send for "Heald's College Journal," and learn full particulars. Sent free to all by addressing E. P. HEALD, Pres. Business College, San Francisco, Cal. 2v27-1y

HALLIDIE'S
Patent Endless Wire Ropeway.
Covered by Numerous U. S. Patents.
IMPORTANT TO
Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

Eureka, Nevada, July 10, 1872.

T. M. Martin My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Frelburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, C. C. GOODWIN.

Emma Hill Consolidated Mining Co., Little Cottonwood, Utah, Superintendent's Office, Sept. 28, 1872.

T. M. Martin, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,
L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its loading or as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 2014.

A. S. HALLIDIE, Patentee,

Machinery.

TO HYDRAULIC MINERS.

I warn Hydraulic Miners not to be misled by the advertisement of Mr. F. H. Fisher. Said Fisher has been beaten in every suit to which he has been a party (respecting Patent Rights on Hydraulic Machines), whether as plaintiff or defendant.

His patrons have already paid over Five Thousand Dollars for license to use machines purchased of the self styled

"Only Reliable Party in the Business Who Protects His Customers."

Fisher's Machine is worthless unless the discharge pipe is furnished with appliances, the patent for which is owned by Messrs. CRAIG, and which Fisher is enjoined from making.

The Machine itself is also an infringement on another patent owned by the same parties.

All persons infringing on either of these patents

WILL BE PROMPTLY PROSECUTED.

I am sole LICENSEE to sell Machines manufactured under Craig's, Rice's, Macey's and Hoskin's patents.

I Guarantee Full Indemnity to all my Customers.

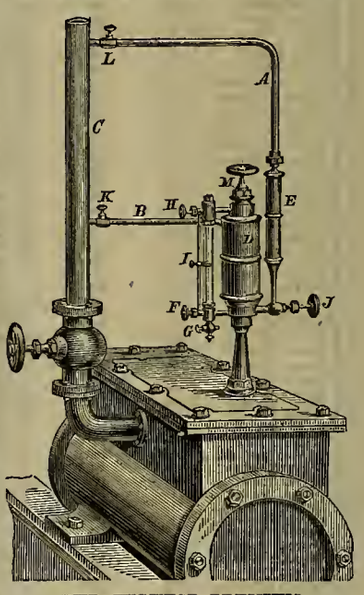
Machines of all sizes always on hand.

If you want a Machine that will give satisfaction, and do not want to pay for it twice over, buy an Improved LITTLE GIANT.

For further particulars apply to

R. HOSKIN, Dutch Flat,
R. R. & J. CRAIG, 304 Montgomery st., S. F.
Or WILLIAMSON & CORY, Marysville.
Dutch Flat, August 1, 1873. 6v27-2m

N. Seibert's Eureka Lubricators.

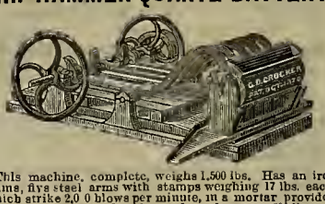


THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

CROCKER'S PATENT
TRIP HAMMER QUARTZ BATTERY.



This machine, complete, weighs 1,500 lbs. Has an iron frame, five steel arms with stamps weighing 17 lbs. each, which strike 2,0 0 blows per minute, in a mortar provided with screens on both sides, and crushes FINE 600 lbs. per hour, requiring one-horse power to drive it. Has been thoroughly tested, and is guaranteed to give good satisfaction. PRICE, $600.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.
Setters made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.
Mill-men are invited to examine these pans and setters for themselves, at the office, 229 Fremont Street, San Francisco

Friel's Patent Paragon Vapor Stove.

PATENT GRANTED MAY 20, 1873.

The Great Labor Saver of the Household.

ECONOMY, CONVENIENCE AND SAFETY COMBINED.

JUST THINK OF IT—No Wood, no Coal, no Coal Gas, no Stove Pipe, no Chimney, no Smoke, no Ashes, no Dirt, no Wood Boxes, no Coal Scuttles, no Kindling Wood, but a Friction Match, and the

Fire in Full Blast in Half a Minute!

OVEN HOT IN TWO MINUTES.
Steak broiled in seven minutes! Baked Beans in thirty minutes! The fire extinguished in a moment And the house unheated!
It has no rival in all kinds of Cooking and Flat Iron Heating, and combines Economy, Convenience, Neatness, Safety and Durability! The Ladies welcome it; a little Child can operate it, and

All Recommend It.

Prices from $5 to $25, according to size. Manufactured and sold by WM. FRIEL,
69 and 71 Fourth street, San Francisco.
N. B.—Agents wanted in every town in the State. On payment of $5, one Stove will be sent as sample.
22v25-2amly

THE CALIFORNIA

BUTTER COMPANY

Would respectfully inform the public that they are now prepared to supply the market with the

BEST QUALITY

—OF—

FRESH BUTTER,

In Lots to Suit Purchasers. at Greatly Reduced Prices.

OFFICE AND MANUFACTORY:

405 and 407 Sansome St., San Francisco.

WEST EVANS, President.
HENRY PHILIPS, General Manager.

JOHN G. BAKER, Secretary.
21v27-3m

JUST PUBLISHED.

Froiseth's New Sectional, Topographical and Mineral

MAP OF UTAH.

SIZE, 40 BY 56 INCHES; SCALE, 8 MILES TO AN INCH.

Handsomely engraved on stone, colored in counties, and mounted on cloth, showing the Counties, Towns, Rivers, Lakes, Railroads, Mines and Mining Districts throughout the Territory, and all GOVERNMENT SURVEYS made to date. Price, mounted, $8; Pocket form, $5.

—ALSO—

New Mining Map of Utah,

Showing the boundaries of the principal mining districts, some 30 in number, adjacent to Salt Lake City. Price, pocket form, $2.50.

—ALSO—

Froissth's New Map of Little Cottonwood Mining District and Vicinity,

Showing the location of some 400 mines and tunnel sites, together with the mines surveyed for U. S. Patent. Price $3. For sale and mailed to any part of the globe, on receipt of price, by A. L. BANCROFT & CO., A. ROMAN & CO., and LECOUNT BROS. & MANSUR, San Francisco. 10v25-tf

H. S. CROCKER & CO.,

IMPORTING AND WHOLESALE

Stationers and Mercantile Job Printers,

Nos. 401 and 403 Sansome Street, SAN FRANCISCO.

PACIFIC COAST AGENCY AMERICAN LEAD PENCIL COMPANY.

Leroy W. Fairchild's Gold Pens and Pencil

Chas. Eneu Johnson & Co.'s Fine Printing Inks.

JOHN D. YOST, San Francisco. H. S. CROCKER, Sacramento
19v27-bp3m

BLISS & WILLIAMS,

167 to 173 Plymouth street, Brooklyn, N. Y.,

Manufacturers of Presses, Dies and Tools

FOR MAKING

SALMON, FRUIT AND OTHER CANS,

And working Sheet Metals in all forms. Catalogues furnished upon application. 20v27-3m

GALVANIZED IRON.

For sale for cash, at 50 per cent. less than market prices—Nos. 20 to 28. Also Galvanized Leaders and Chimney Tops and Hydraulic Pipe manufactured.
MARTIN PRAG,
125 Clay street, below Davis

List of Patents

And Trade Marks Issued to Inventors on the Pacific Coast.

Adding Attachment, G. Lindermoos.....25
Amalgamating Pan, Ira S. Parke.....23
Artificial Stone, Process of Manufacturing, E L Ransome.....412
Apparatus for Compressing Dust Certain Liquid to State, Horace W Barnum.....412
*Attachment for Horse Shoes, R K. Jordan.....25
Bed Bottom, C. V. B. Reeder.....41
Bee Hive, G. Muller.....252
Beer Drawing Attachment for Casks, W. Jobst.....124
Blow Pipe, J. E. McClure.336
Boats, Flexible Vertically Extensible Attachment for, J R Adams.....233
Boiler and Furnace, F. A. Huntington.....73
Bolt and Rivet Machine N. Beauregard.....169
Boots, Pegging Tacks for 73
Box Crimping Blocks, Bordner & Sullivan.....135
Bottle and Can Clamp, J. N. Carter.....9
Bottle Corking Machine, J. Armstrong.....231
Bourbon Whisky, E A Fargo & Co.....412
Box Former, C. W. Cowan.....233
Boxes, Machine for Making, G. W. Swan.....169
Brake, Reactionary Movement, H. H. Martin.. 9
BreastPlate for Blast Furnaces, R. A. Fisher.....89
*Bridge, Truss, Bannister 49
Brush and Broom Inserter, Van Laak & Gillespie.. 73
Burial Case, J. B. Cox....264 and 345.
Cam for Stamps, J. M. Thompson.....25
*Can and Faucet, Hammond & Mygatt.....225
Candlestick, S. D. Hill...169
Candle Guard, S. Morgan 59
Car Axle Box, W J L Moulton.....396
Car Coupling, R. B. Buckner.....137, 345
Car Coupling, M. Divney ..25
Car Coupling, Taylor & Withington.....220
Carpet Cleaner, J. Spaulding.....105
Catch Lock, A. M. Williams.....105
Cleaner & Crusher, Grain and Malt, Nicholas Thielan.....412
*Clothes Line Reel and Tightener, J. Brizee....105
*Coal Screen and Chute M. R. Roberts.....145
Cobble Stone Facing Machine, L. Dutertrs.....169
Oobble Stones, Machine for Cutting, Lombard, Terrell & Newell.....384
Compound for Cleaning Metels, W. Z. Moore....336
Compressing Air, Apparatus for, R. S. Pardee..231
Construction of Tunnels and Sewers, G. Knoll..313
Cooking Furnace (2), H. Engleman.....137
*Cooking Range, J. H. Mitchell.....37, 265
Coupling for Gas and Water Pipes, W. Kilburn....73
Dental Fillings, Charles E Blake.....412
Devloe for Detaching Horses, S. Sykes.....264
English Patents.....73
Engine, Steam and Air, Frank J Cronch.....412
Egg Carrier, F M Wade...396
Fastening for the Seating Rails or Sashes, M. Gee.137
*Feed Screws, Divided Nut for, F. A. Hunting-ton.....281, 345
*Filter, Prosper Huenie..177
Fly Trap, Packard & Standish.....380
Fruit Box, O. W. Weston 73
Fruit and Berry Basket G. W. Swan.....169
*Furnace, Mcgilew's..10, 65, 73
Gas, Manufacture of, W. H. Sterling.....220
Gate, E Hickman.....396
Glove Fastener, Letitia Ferris.....336
Governor Cut Off Gear, H. H. Meyer.....185
Governor for Engines, J. Hendy.....41
Grain Separator, S. Daw..380
Hand Wagon, S. D. Scott 169
Harness Attachment, Crowell, Tillman & Vandenburg.....169
Harrow, P. N. Woodworth 9
Harvester and Thresher J. H. Adamson.....41
Hay and Grain Unloader, W. J. Palmer.....137
Heater and Blower, W. M. Jackson.....185
Horse Hoy Fork, S. B. Ferris.....153
Horse Shoe, R K Jordan..396
Hose Coupling, W. Killburn.....261
Hydraulic Jack, A. F. Ojeda.....105, 152
Hydraulic Hoist, T Stehine.....73
Hydraulic Hoisting Apparatus, P. Hinkle...41, 494
Hydraulic Motor, W. Walter.....159
Incrustation, Preventing in Boilers, R. A. Fisher 25
Ingot Mould, John Fair..368
Kindling Wood Cutter, N. Sonnischen.....25
Kettle and Pan Scraper, E. J. Whitman.....204
Laundry Stove, J. H. Mitchell.....169, 265
Locking Latch for Doors, Machine Combined, J Hyde.....264
Lubricator, W. Burnett.. 73
Lubricator, J. M. L. Power.....281
Lubricating Device for Car Axle, W J L Moulton.....396
Machine for Clearing Streets and Sewers, W. F. Ballinger.....233
Manufacture of Copper Ingots for Alloying Gold and Silver, John Feix..380
Mechanical Key and Symbol for Telegraphs, D. L. Parkhurst.....242, 345
Medical Compound, P. H. Steenhergen.....153, 345
Medical Compound, W. H. White.....25
Metallic Foil for Dental Purposes, C B Blake....412
Mill Pick, M. N. Young..169 345.
Mitre Box, J. P. Tierney..220 345.
Mortising Machine, J. Driver.....25
Motive Power for Sewing Machines, Backus, Sawyer & Loryea.....73
Music, Apparatus for Teaching, L. A. Seward..31
Needle Threader for Sewing Machines, T Schofield.....233
Oil Cloth, Method of Printing, W E Worth....412
*Ore Concentrator, J. A. Peer.....204, 274
Ore Concentrator, Thomas Arstin.....9
*Ore Stamp Feeder, Cusenbary & Mars.....25, 97
Ore Stamp Feeder, Jamea Fair.....412
Ore Stamp, G. D. Crocker 121
Ore Stamp, L. D. Webb..264
Ore Washer, J. A. Peer...204
Paint Brush, S. Standish. 25
Paint, Fireproof, W. H. Devlin 369
Pavement, W. Kilburn. 73
Pan Holder, J. S. Orndorf.....169
Pipe Manufacture, C. L. Feegan.....185
Plow, J. C. Potter.....25
Plow, Subsoil Gang, Chrs. Myer.....124
Porter's Bar, J. Barman..220
Preserving Iron, W. H. Starling.....73
Printers' Leads, Apparatus for Cutting, W. Filmer..220
Process for Purifying Quicksilver, Randal & Wright.....330
Process for making Coke from Lignites, H. Engleman.....73
Process for Separating Silver from other metals T. Wiegand.....396
Process for Softening and Toughening Wood, G W Swan.....169
Pump and Plunger, N P Sheridan.....9
Pump, Rotary, Goodwin & West.....73
Reciprocating Engine, A Sinclair.....204
Refiner for Distilling Apparatus.....73
Road Scraper, R F Reed..289
Rotary Blower, C. Knox 41
Rotating Blanket Sluice for Washing Ores, W H Patton.....169
Saddle for Wire ways, J. Bleasdale.....233, 404
Screw Post for Electrical Purposes, S D Field.....64
Scroll Sawing Machine. M Bannister.....89
Scrubbing Brush, Mop and Wringer, J D Smith 64 404
Shaft Coupling, W J Silver.....169
Shank Laster, W H Hanna.....380
Sheep Shears, A S McWilliams.....25, 404
Shoe Fastening, Fitch & Jones.....264, 345
Shoemaker's Pincers, W H Hanna.....89
Shoe Uppers, Method of Laying off, C Glanville..313
Table Board, Adjustable, J Tish.....65
Smoke and Steam Burner, Kingman & Burgins.....105
Sole Bedstead, S M Winn..264
Solderine Pots, L Cailing 396
Spring Joint for Watch Cases, J Gordon.....89
